## 1 Introduction

The i.MX 6Solo/6DualLite automotive and infotainment processors represent the latest achievement in integrated multimedia-focused products offering high-performance processing with a high degree of functional integration. These processors are designed considering the needs of the growing automotive infotainment, telematics, HMI, and display-based cluster markets.

The processors feature advanced implementation of single/dual ARM<sup>®</sup> Cortex<sup>®</sup>-A9 core, which operates at speeds of up to 800 MHz. They include 2D and 3D graphics processors, 1080p video processing, and integrated power management. Each processor provides a 32/64-bit DDR3/DDR3L/LPDDR2-800 memory interface and a number of other interfaces for connecting peripherals, such as WLAN, Bluetooth<sup>®</sup>, GPS, hard drive, displays, and camera sensors.

The i.MX 6Solo/6DualLite processors are specifically useful for applications such as:

- Automotive navigation and entertainment
- Graphics rendering for Human Machine Interfaces (HMI)
- High-performance speech processing with large databases
- Audio playback
- Video processing and display

The i.MX 6Solo/6DualLite applications processors feature:

- **Multilevel memory system**—The multilevel memory system of each processor is based on the L1 instruction and data caches, L2 cache, and internal and external memory. The processors support many types of external memory devices, including DDR3, low voltage DDR3, LPDDR2, NOR Flash, PSRAM, cellular RAM, NAND Flash (MLC and SLC), OneNAND™, and managed NAND, including eMMC up to rev 4.4/4.41.
- **Smart speed technology**—The processors have power management throughout the IC that enables the rich suite of multimedia features and peripherals to consume minimum power in both active and various low power modes. Smart speed technology enables the designer to deliver a feature-rich product, requiring levels of power far lower than industry expectations.
- **Dynamic voltage and frequency scaling**—The processors improve the power efficiency of devices by scaling the voltage and frequency to optimize performance.
- **Multimedia powerhouse**—The multimedia performance of each processor is enhanced by a multilevel cache system, NEON™ MPE (Media Processor Engine) co-processor, a multi-standard hardware video codec, an image processing unit (IPU), a programmable smart DMA (SDMA) controller, and an asynchronous sample rate converter.
- **Powerful graphics acceleration**—Each processor provides two independent, integrated graphics processing units: an OpenGL® ES 2.0 3D graphics accelerator with a shader and a 2D graphics accelerator.
- **Interface flexibility**—Each processor supports connections to a variety of interfaces: LCD controller for up to two displays (including parallel display, HDMI1.4, MIPI display, and LVDS display), dual CMOS sensor interface (parallel or through MIPI), high-speed USB on-the-go with PHY, high-speed USB host with PHY, multiple expansion card ports (high-speed MMC/SDIO host and other), 10/100/1000 Mbps Gigabit Ethernet controller two CAN ports, ESAI audio interface, and a variety of other popular interfaces (such as UART, I²C, and I²S serial audio, and PCIe-II).
- **Automotive environment support**—Each processor includes interfaces, such as two CAN ports, an MLB150/50 port, an ESAI audio interface, and an asynchronous sample rate converter for multichannel/multisource audio.
- **Advanced security**—The processors deliver hardware-enabled security features that enable secure e-commerce, digital rights management (DRM), information encryption, secure boot, and secure software downloads. The security features are discussed in detail in the *i.MX 6Solo/6DualLite Security Reference Manual (IMX6DQ6SDLSRM)*.
- **Integrated power management**—The processors integrate linear regulators and internally generate voltage levels for different domains. This significantly simplifies system power management structure.

## 1.1 Ordering Information

**Table 1** provides examples of orderable part numbers covered by this data sheet. **Table 1** does not include all possible orderable part numbers. The latest part numbers are available on the web page [nxp.com/imx6series](http://nxp.com/imx6series). If the desired part number is not listed in **Table 1**, or there may be any questions about available parts, see the web page [nxp.com/imx6series](http://nxp.com/imx6series) or contact an NXP representative.

<sup>1</sup> If a 24 MHz input clock is used (required for USB), the maximum SoC speed is limited to 792 MHz

Figure 1 describes the part number nomenclature so that the users can identify the characteristics of the specific part number they have (for example, cores, frequency, temperature grade, fuse options, and silicon revision). The primary characteristic which describes which data sheet applies to a specific part is the temperature grade (junction) field.

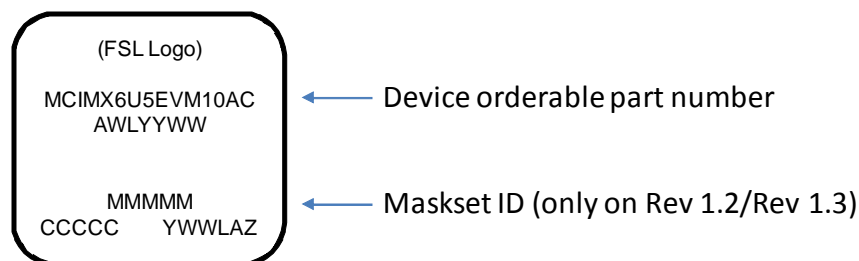

- The i.MX 6Solo/6DualLite Automotive and Infotainment Applications Processors data sheet (IMX6SDLAEC) covers parts listed with an “A (Automotive temp)”
- The i.MX 6Solo/6DualLite Applications Processors for Consumer Products data sheet (IMX6SDLCEC) covers parts listed with a “D (Commercial temp)” or “E (Extended Commercial temp)”
- The i.MX 6Solo/6DualLite Applications Processors for Industrial Products data sheet (IMX6SDLIEC) covers parts listed with “C (Industrial temp)”

Ensure to have the proper data sheet for specific part by verifying the temperature grade (junction) field and matching it to the proper data sheet. If there will be any questions, visit see the web page [nxp.com/imx6series](http://nxp.com/imx6series) or contact a NXP representative for details.

1. See the [nxp.com/imx6series](http://nxp.com/imx6series) Web page for latest information on the available silicon revision.
2. If a 24 MHz input clock is used (required for USB), the maximum SoC speed is limited to 792 MHz.
3. If a 24 MHz input clock is used (required for USB), the maximum SoC speed is limited to 996 MHz.

## 1.2 Features

The i.MX 6Solo/6DualLite processors are based on ARM Cortex-A9 MPCore™ Platform, which has the following features:

- The i.MX 6Solo supports single ARM Cortex-A9 MPCore (with TrustZone)
- The i.MX 6DualLite supports dual ARM Cortex-A9 MPCore (with TrustZone)
- The core configuration is symmetric, where each core includes:
  - 32 KByte L1 Instruction Cache
  - 32 KByte L1 Data Cache
  - Private Timer and Watchdog
  - Cortex-A9 NEON MPE (Media Processing Engine) Co-processor

The ARM Cortex-A9 MPCore™ complex includes:

- General Interrupt Controller (GIC) with 128 interrupt support
- Global Timer
- Snoop Control Unit (SCU)
- 512 KB unified I/D L2 cache:
  - Used by one core in i.MX 6Solo
  - Shared by two cores in i.MX 6DualLite
- Two Master AXI bus interfaces output of L2 cache
- Frequency of the core (including NEON and L1 cache), as per [Table 8](#).
- NEON MPE coprocessor
  - SIMD Media Processing Architecture
  - NEON register file with 32x64-bit general-purpose registers
  - NEON Integer execute pipeline (ALU, Shift, MAC)
  - NEON dual, single-precision floating point execute pipeline (FADD, FMUL)
  - NEON load/store and permute pipeline

The SoC-level memory system consists of the following additional components:

- Boot ROM, including HAB (96 KB)
- Internal multimedia / shared, fast access RAM (OCRAM, 128 KB)
- Secure/non-secure RAM (16 KB)
- External memory interfaces: The i.MX 6Solo/6DualLite processors support latest, high volume, cost effective handheld DRAM, NOR, and NAND Flash memory standards.
  - 16/32-bit LP-DDR2-800, 16/32-bit DDR3-800 and DDR3L-800 in i.MX 6Solo; 16/32/64-bit LP-DDR2-800, 16/32/64-bit DDR3-800 and DDR3L-800, supporting DDR interleaving mode for 2x32 LPDDR2-800 in i.MX 6DualLite
  - 8-bit NAND-Flash, including support for Raw MLC/SLC, 2 KB, 4 KB, and 8 KB page size, BA-NAND, PBA-NAND, LBA-NAND, OneNAND™ and others. BCH ECC up to 40 bit.
  - 16/32-bit NOR Flash. All WEIMv2 pins are muxed on other interfaces.
  - 16/32-bit PSRAM, Cellular RAM

Each i.MX 6Solo/6DualLite processor enables the following interfaces to external devices (some of them are muxed and not available simultaneously):

- Displays—Total of four interfaces available. Total raw pixel rate of all interfaces is up to 450 Mpixels/sec, 24 bpp. Up to two interfaces may be active in parallel.
  - One Parallel 24-bit display port, up to 225 Mpixels/sec (for example, WUXGA at 60 Hz or dual HD1080 and WXGA at 60 Hz)
  - LVDS serial ports—One port up to 165 Mpixels/sec or two ports up to 85 MP/sec (for example, WUXGA at 60 Hz) each
  - HDMI 1.4 port
  - MIPI/DSI, two lanes at 1 Gbps

- Camera sensors:
  - Two parallel Camera ports (up to 20 bit and up to 240 MHz peak)
  - MIPI CSI-2 Serial port, supporting from 80 Mbps to 1 Gbps speed per data lane. The CSI-2 Receiver core can manage one clock lane and up to two data lanes. Each i.MX 6Solo/6DualLite processor has two lanes.
- Expansion cards:
  - Four MMC/SD/SDIO card ports all supporting:
    - 1-bit or 4-bit transfer mode specifications for SD and SDIO cards up to UHS-I SDR-104 mode (104 MB/s max)
    - 1-bit, 4-bit, or 8-bit transfer mode specifications for MMC cards up to 52 MHz in both SDR and DDR modes (104 MB/s max)
- USB:
  - One high speed (HS) USB 2.0 OTG (Up to 480 Mbps), with integrated HS USB Phy
  - Three USB 2.0 (480 Mbps) hosts:
    - One HS host with integrated High Speed Phy
    - Two HS hosts with integrated HS-IC USB (High Speed Inter-Chip USB) Phy
- Expansion PCI Express port (PCIe) v2.0 one lane
  - PCI Express (Gen 2.0) dual mode complex, supporting Root complex operations and Endpoint operations. Uses x1 PHY configuration.
- Miscellaneous IPs and interfaces:
  - SSI block is capable of supporting audio sample frequencies up to 192 kHz stereo inputs and outputs with I<sup>2</sup>S mode
  - ESAI is capable of supporting audio sample frequencies up to 260 kHz in I<sup>2</sup>S mode with 7.1 multi channel outputs
  - Five UARTs, up to 5.0 Mbps each:
    - Providing RS232 interface
    - Supporting 9-bit RS485 multidrop mode
    - One of the five UARTs (UART1) supports 8-wire while others four supports 4-wire. This is due to the SoC IOMUX limitation, since all UART IPs are identical.
  - Four eCSPI (Enhanced CSPI)
  - Four I<sup>2</sup>C, supporting 400 kbps
  - Gigabit Ethernet Controller (IEEE1588 compliant), 10/100/1000<sup>1</sup> Mbps
  - Four Pulse Width Modulators (PWM)
  - System JTAG Controller (SJC)
  - GPIO with interrupt capabilities
  - 8x8 Key Pad Port (KPP)
  - Sony Philips Digital Interconnect Format (SPDIF), Rx and Tx

1. The theoretical maximum performance of 1 Gbps ENET is limited to 470 Mbps (total for Tx and Rx) due to internal bus throughput limitations. The actual measured performance in optimized environment is up to 400 Mbps. For details, see the ERR004512 erratum in the i.MX 6Solo/6DualLite errata document (IMX6SDLCE).

- Two Controller Area Network (FlexCAN), 1 Mbps each
- Two Watchdog timers (WDOG)
- Audio MUX (AUDMUX)
- MLB (MediaLB) provides interface to MOST Networks (MOST25, MOST50, MOST150) with the option of DTCP cipher accelerator

The i.MX 6Solo/6DualLite processors integrate advanced power management unit and controllers:

- Provide PMU, including LDO supplies, for on-chip resources
- Use Temperature Sensor for monitoring the die temperature
- Support DVFS techniques for low power modes
- Use SW State Retention and Power Gating for ARM and MPE
- Support various levels of system power modes
- Use flexible clock gating control scheme

The i.MX 6Solo/6DualLite processors use dedicated hardware accelerators to meet the targeted multimedia performance. The use of hardware accelerators is a key factor in obtaining high performance at low power consumption numbers, while having the CPU core relatively free for performing other tasks.

The i.MX 6Solo/6DualLite processors incorporate the following hardware accelerators:

- VPU—Video Processing Unit
- IPUv3H—Image Processing Unit version 3H
- GPU3Dv5—3D Graphics Processing Unit (OpenGL ES 2.0) version 5
- GPU2Dv2—2D Graphics Processing Unit (BitBlit)
- ASRC—Asynchronous Sample Rate Converter

Security functions are enabled and accelerated by the following hardware:

- ARM TrustZone including the TZ architecture (separation of interrupts, memory mapping, etc.)
- SJC—System JTAG Controller. Protecting JTAG from debug port attacks by regulating or blocking the access to the system debug features.
- CAAM—Cryptographic Acceleration and Assurance Module, containing cryptographic and hash engines, 16 KB secure RAM, and True and Pseudo Random Number Generator (NIST certified).
- SNVS—Secure Non-Volatile Storage, including Secure Real Time Clock
- CSU—Central Security Unit. Enhancement for the IC Identification Module (IIM). Will be configured during boot and by eFUSES and will determine the security level operation mode as well as the TZ policy.
- A-HAB—Advanced High Assurance Boot—HABv4 with the new embedded enhancements: SHA-256, 2048-bit RSA key, version control mechanism, warm boot, CSU, and TZ initialization.

### NOTE

The actual feature set depends on the part numbers as described in [Table 1, "Example Orderable Part Numbers," on page 3](#). Functions, such as video hardware acceleration, and 2D and 3D hardware graphics acceleration may not be enabled for specific part numbers.

## 1.3 Updated Signal Naming Convention

The signal names of the i.MX6 series of products have been standardized to better align the signal names within the family and across the documentation. Some of the benefits of these changes are as follows:

- The names are unique within the scope of an SoC and within the series of products
- Searches will return all occurrences of the named signal
- The names are consistent between i.MX 6 series products implementing the same modules
- The module instance is incorporated into the signal name

This change applies only to signal names. The original ball names have been preserved to prevent the need to change schematics, BSDL models, IBIS models, etc.

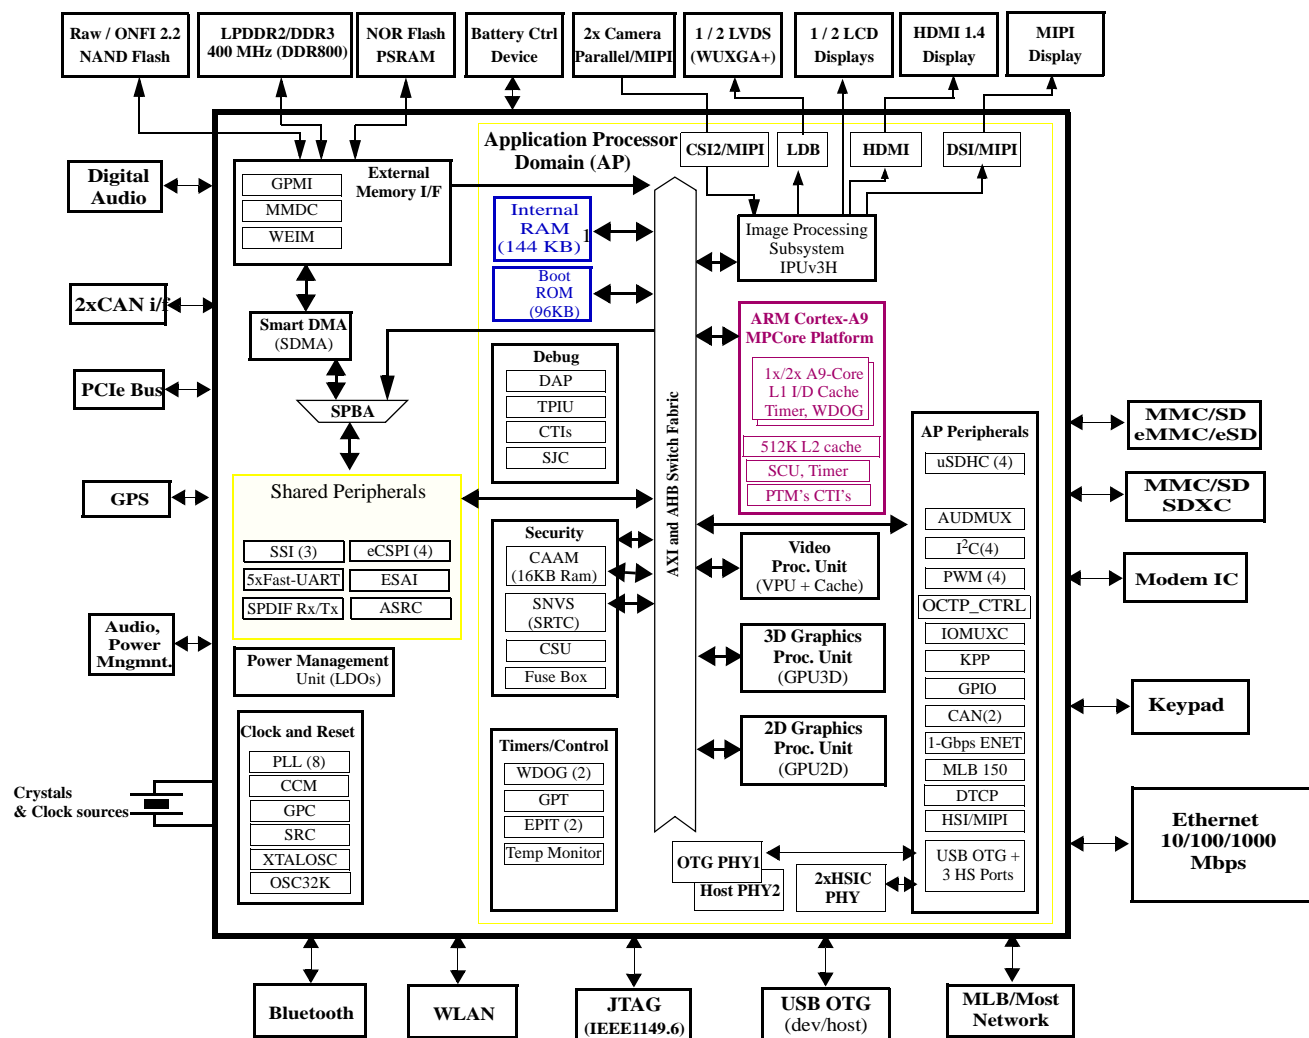

Throughout this document, the updated signal names are used except where referenced as a ball name (such as the Functional Contact Assignments table, Ball Map table, and so on). A master list of the signal name changes is in the document, *IMX 6 Series Signal Name Mapping* (EB792). This list can be used to map the signal names used in older documentation to the new standardized naming conventions.

## 2 Architectural Overview

The following subsections provide an architectural overview of the i.MX 6Solo/6DualLite processor system.

### 2.1 Block Diagram

Figure 3 shows the functional modules in the i.MX 6Solo/6DualLite processor system.

<sup>1</sup> 144 KB RAM including 16 KB RAM inside the CAAM.

<sup>2</sup> For i.MX 6Solo, there is only one A9-core platform in the chip; for i.MX 6DualLite, there are two A9-core platforms.

**Figure 3. i.MX 6Solo/6DualLite System Block Diagram**

#### NOTE

The numbers in brackets indicate number of module instances. For example, PWM (4) indicates four separate PWM peripherals.

### 3 Modules List

The i.MX 6Solo/6DualLite processors contain a variety of digital and analog modules. [Table 2](#) describes these modules in alphabetical order.

**Table 2. i.MX 6Solo/6DualLite Modules List**

Block Mnemonic	Block Name	Subsystem	Brief Description
ARM	ARM Platform	ARM	The ARM Core Platform includes 1x (Solo) Cortex-A9 core for i.MX 6Solo and 2x (Dual) Cortex-A9 cores for i.MX 6DualLite. It also includes associated sub-blocks, such as the Level 2 Cache Controller, SCU (Snoop Control Unit), GIC (General Interrupt Controller), private timers, watchdog, and CoreSight debug modules.
APBH-DMA	NAND Flash and BCH ECC DMA controller	System Control Peripherals	DMA controller used for GPMI2 operation
ASRC	Asynchronous Sample Rate Converter	Multimedia Peripherals	The Asynchronous Sample Rate Converter (ASRC) converts the sampling rate of a signal associated to an input clock into a signal associated to a different output clock. The ASRC supports concurrent sample rate conversion of up to 10 channels of about -120dB THD+N. The sample rate conversion of each channel is associated to a pair of incoming and outgoing sampling rates. The ASRC supports up to three sampling rate pairs.
AUDMUX	Digital Audio Mux	Multimedia Peripherals	The AUDMUX is a programmable interconnect for voice, audio, and synchronous data routing between host serial interfaces (for example, SSI1, SSI2, and SSI3) and peripheral serial interfaces (audio and voice codecs). The AUDMUX has seven ports with identical functionality and programming models. A desired connectivity is achieved by configuring two or more AUDMUX ports.
BCH40	Binary-BCH ECC Processor	System Control Peripherals	The BCH40 module provides up to 40-bit ECC for NAND Flash controller (GPMI)
CAAM	Cryptographic accelerator and assurance module	Security	CAAM is a cryptographic accelerator and assurance module. CAAM implements several encryption and hashing functions, a run-time integrity checker, and a Pseudo Random Number Generator (PRNG). The pseudo random number generator is certified by Cryptographic Algorithm Validation Program (CAVP) of National Institute of Standards and Technology (NIST). Its DRBG validation number is 94 and its SHS validation number is 1455. CAAM also implements a Secure Memory mechanism. In i.MX 6Solo/6DualLite processors, the security memory provided is 16 KB.
CCM GPC SRC	Clock Control Module, General Power Controller, System Reset Controller	Clocks, Resets, and Power Control	These modules are responsible for clock and reset distribution in the system, and also for the system power management.
CSI	MIPI CSI-2 i/f	Multimedia Peripherals	The CSI IP provides MIPI CSI-2 standard camera interface port. The CSI-2 interface supports from 80 Mbps to 1 Gbps speed per data lane.

Table 2. i.MX 6Solo/6DualLite Modules List (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
CSU	Central Security Unit	Security	The Central Security Unit (CSU) is responsible for setting comprehensive security policy within the i.MX 6Solo/6DualLite platform.
CTI-0 CTI-1 CTI-2 CTI-3 CTI-4	Cross Trigger Interfaces	Debug / Trace	Cross Trigger Interfaces allows cross-triggering based on inputs from masters attached to CTIs. The CTI module is internal to the Cortex-A9 Core Platform.
CTM	Cross Trigger Matrix	Debug / Trace	Cross Trigger Matrix IP is used to route triggering events between CTIs. The CTM module is internal to the Cortex-A9 Core Platform.
DAP	Debug Access Port	System Control Peripherals	The DAP provides real-time access for the debugger without halting the core to: <ul style="list-style-type: none"> <li>• System memory and peripheral registers</li> <li>• All debug configuration registers</li> </ul> The DAP also provides debugger access to JTAG scan chains. The DAP module is internal to the Cortex-A9 Core Platform.
DCIC-0 DCIC-1	Display Content Integrity Checker	Automotive IP	The DCIC provides integrity check on portion(s) of the display. Each i.MX 6Solo/6DualLite processor has two such modules.
DSI	MIPI DSI i/f	Multimedia Peripherals	The MIPI DSI IP provides DSI standard display port interface. The DSI interface support 80 Mbps to 1 Gbps speed per data lane.
DTCP	DTCP	Multimedia Peripherals	Provides encryption function according to Digital Transmission Content Protection standard for traffic over MLB150.
eCSPI1-4	Configurable SPI	Connectivity Peripherals	Full-duplex enhanced Synchronous Serial Interface. It is configurable to support Master/Slave modes, four chip selects to support multiple peripherals.
ENET	Ethernet Controller	Connectivity Peripherals	<p>The Ethernet Media Access Controller (MAC) is designed to support 10/100/1000 Mbps Ethernet/IEEE 802.3 networks. An external transceiver interface and transceiver function are required to complete the interface to the media. The module has dedicated hardware to support the IEEE 1588 standard. See the ENET chapter of the reference manual for details.</p> <p><b>Note:</b> The theoretical maximum performance of 1 Gbps ENET is limited to 470 Mbps (total for Tx and Rx) due to internal bus throughput limitations. The actual measured performance in optimized environment is up to 400 Mbps. For details, see the ERR004512 erratum in the i.MX 6Solo/6DualLite errata document (IMX6SDLCE).</p>

Table 2. i.MX 6Solo/6DualLite Modules List (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
EPIT-1 EPIT-2	Enhanced Periodic Interrupt Timer	Timer Peripherals	Each EPIT is a 32-bit “set and forget” timer that starts counting after the EPIT is enabled by software. It is capable of providing precise interrupts at regular intervals with minimal processor intervention. It has a 12-bit prescaler for division of input clock frequency to get the required time setting for the interrupts to occur, and counter value can be programmed on the fly.
ESAI	Enhanced Serial Audio Interface	Connectivity Peripherals	The Enhanced Serial Audio Interface (ESAI) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, SPDIF transceivers, and other processors. The ESAI consists of independent transmitter and receiver sections, each section with its own clock generator. All serial transfers are synchronized to a clock. Additional synchronization signals are used to delineate the word frames. The normal mode of operation is used to transfer data at a periodic rate, one word per period. The network mode is also intended for periodic transfers; however, it supports up to 32 words (time slots) per period. This mode can be used to build time division multiplexed (TDM) networks. In contrast, the on-demand mode is intended for non-periodic transfers of data and to transfer data serially at high speed when the data becomes available. The ESAI has 12 pins for data and clocking connection to external devices.

Block Mnemonic	Block Name	Subsystem	Brief Description
512x8 Fuse Box	Electrical Fuse Array	Security	Electrical Fuse Array. Enables to setup Boot Modes, Security Levels, Security Keys, and many other system parameters. The i.MX 6Solo/6DualLite processors consist of 512x8-bit fuse box accessible through OCOTP_CTRL interface.
GPIO-1 GPIO-2 GPIO-3 GPIO-4 GPIO-5 GPIO-6 GPIO-7	General Purpose I/O Modules	System Control Peripherals	Used for general purpose input/output to external ICs. Each GPIO module supports 32 bits of I/O.
GPMI	General Purpose Media Interface	Connectivity Peripherals	The GPMI module supports up to 8x NAND devices. 40-bit ECC encryption/decryption for NAND Flash controller (GPMI2). The GPMI supports separate DMA channels per NAND device.
GPT	General Purpose Timer	Timer Peripherals	Each GPT is a 32-bit “free-running” or “set and forget” mode timer with programmable prescaler and compare and capture register. A timer counter value can be captured using an external event and can be configured to trigger a capture event on either the leading or trailing edges of an input pulse. When the timer is configured to operate in “set and forget” mode, it is capable of providing precise interrupts at regular intervals with minimal processor intervention. The counter has output compare logic to provide the status and interrupt at comparison. This timer can be configured to run either on an external clock or on an internal clock.
GPU3Dv5	Graphics Processing Unit, ver.5	Multimedia Peripherals	The GPU3Dv5 provides hardware acceleration for 3D graphics algorithms with sufficient processor power to run desktop quality interactive graphics applications on displays up to HD1080 resolution. The GPU3D provides OpenGL ES 2.0, including extensions, OpenGL ES 1.1, and OpenVG 1.1
GPU2Dv2	Graphics Processing Unit-2D, ver 2	Multimedia Peripherals	The GPU2Dv2 provides hardware acceleration for 2D graphics algorithms, such as Bit BLT, stretch BLT, and many other 2D functions.
HDMI Tx	HDMI Tx i/f	Multimedia Peripherals	The HDMI module provides HDMI standard i/f port to an HDMI 1.4 compliant display.
HSI	MIPI HSI i/f	Connectivity Peripherals	The MIPI HSI provides a standard MIPI interface to the applications processor.
I <sup>2</sup> C-1 I <sup>2</sup> C-2 I <sup>2</sup> C-3 I <sup>2</sup> C-4	I <sup>2</sup> C Interface	Connectivity Peripherals	I <sup>2</sup> C provide serial interface for external devices. Data rates of up to 400 kbps are supported.
IOMUXC	IOMUX Control	System Control Peripherals	This module enables flexible IO multiplexing. Each IO pad has default and several alternate functions. The alternate functions are software configurable.

Block Mnemonic	Block Name	Subsystem	Brief Description
IPUv3H	Image Processing Unit, ver.3H	Multimedia Peripherals	<p>IPUv3H enables connectivity to displays and video sources, relevant processing and synchronization and control capabilities, allowing autonomous operation. The IPUv3H supports concurrent output to two display ports and concurrent input from two camera ports, through the following interfaces:</p> <ul style="list-style-type: none"> <li>• Parallel Interfaces for both display and camera</li> <li>• Single/dual channel LVDS display interface</li> <li>• HDMI transmitter</li> <li>• MIPI/DSI transmitter</li> <li>• MIPI/CSI-2 receiver</li> </ul> <p>The processing includes:</p> <ul style="list-style-type: none"> <li>• Image conversions: resizing, rotation, inversion, and color space conversion</li> <li>• A high-quality de-interlacing filter</li> <li>• Video/graphics combining</li> <li>• Image enhancement: color adjustment and gamut mapping, gamma correction, and contrast enhancement</li> <li>• Support for display backlight reduction</li> </ul>
KPP	Key Pad Port	Connectivity Peripherals	<p>KPP Supports 8x8 external key pad matrix. KPP features are:</p> <ul style="list-style-type: none"> <li>• Open drain design</li> <li>• Glitch suppression circuit design</li> <li>• Multiple keys detection</li> <li>• Standby key press detection</li> </ul>
LDB	LVDS Display Bridge	Connectivity Peripherals	<p>LVDS Display Bridge is used to connect the IPU (Image Processing Unit) to External LVDS Display Interface. LDB supports two channels; each channel has following signals:</p> <ul style="list-style-type: none"> <li>• One clock pair</li> <li>• Four data pairs</li> </ul> <p>Each signal pair contains LVDS special differential pad (PadP, PadM).</p>
MLB150	MediaLB	Connectivity / Multimedia Peripherals	<p>The MLB interface module provides a link to a MOST<sup>®</sup> data network, using the standardized MediaLB protocol (up to 6144 fs). The module is backward compatible to MLB-50.</p>
MMDC	Multi-Mode DDR Controller	Connectivity Peripherals	<p>DDR Controller has the following features:</p> <ul style="list-style-type: none"> <li>• Supports 16/32-bit DDR3-800 (LV) or LPDDR2-800 in i.MX 6Solo</li> <li>• Supports 16/32/64-bit DDR3-800 (LV) or LPDDR2-800 in i.MX 6DualLite</li> <li>• Supports 2x32 LPDDR2-800 in i.MX 6DualLite</li> <li>• Supports up to 4 GByte DDR memory space</li> </ul>

Table 2. i.MX 6Solo/6DualLite Modules List (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
OCOTP_CTRL	OTP Controller	Security	The On-Chip OTP controller (OCOTP_CTRL) provides an interface for reading, programming, and/or overriding identification and control information stored in on-chip fuse elements. The module supports electrically-programmable poly fuses (eFUSES). The OCOTP_CTRL also provides a set of volatile software-accessible signals that can be used for software control of hardware elements, not requiring non-volatility. The OCOTP_CTRL provides the primary user-visible mechanism for interfacing with on-chip fuse elements. Among the uses for the fuses are unique chip identifiers, mask revision numbers, cryptographic keys, JTAG secure mode, boot characteristics, and various control signals, requiring permanent non-volatility.
OCRAM	On-Chip Memory controller	Data Path	The On-Chip Memory controller (OCRAM) module is designed as an interface between system's AXI bus and internal (on-chip) SRAM memory module. In i.MX 6Solo/6DualLite processors, the OCRM is used for controlling the 128 KB multimedia RAM through a 64-bit AXI bus.
OSC32KHz	OSC32KHz	Clocking	Generates 32.768 KHz clock from external crystal.
PCIe	PCI Express 2.0	Connectivity Peripherals	The PCIe IP provides PCI Express Gen 2.0 functionality.
PMU	Power-Management functions	Data Path	Integrated power management unit. Used to provide power to various SoC domains.
PWM-1 PWM-2 PWM-3 PWM-4	Pulse Width Modulation	Connectivity Peripherals	The pulse-width modulator (PWM) has a 16-bit counter and is optimized to generate sound from stored sample audio images and it can also generate tones. It uses 16-bit resolution and a 4x16 data FIFO to generate sound.
RAM 128 KB	Internal RAM	Internal Memory	Internal RAM, which is accessed through OCRM memory controller.
RAM 16 KB	Secure/non-secure RAM	Secured Internal Memory	Secure/non-secure Internal RAM, interfaced through the CAAM.
ROM 96KB	Boot ROM	Internal Memory	Supports secure and regular Boot Modes. Includes read protection on 4K region for content protection.
ROMCP	ROM Controller with Patch	Data Path	ROM Controller with ROM Patch support

Block Mnemonic	Block Name	Subsystem	Brief Description
SDMA	Smart Direct Memory Access	System Control Peripherals	<p>The SDMA is multi-channel flexible DMA engine. It helps in maximizing system performance by off-loading the various cores in dynamic data routing. It has the following features:</p> <ul style="list-style-type: none"> <li>• Powered by a 16-bit Instruction-Set micro-RISC engine</li> <li>• Multi-channel DMA supporting up to 32 time-division multiplexed DMA channels</li> <li>• 48 events with total flexibility to trigger any combination of channels</li> <li>• Memory accesses including linear, FIFO, and 2D addressing</li> <li>• Shared peripherals between ARM and SDMA</li> <li>• Very fast Context-Switching with 2-level priority based preemptive multi-tasking</li> <li>• DMA units with auto-flush and prefetch capability</li> <li>• Flexible address management for DMA transfers (increment, decrement, and no address changes on source and destination address)</li> <li>• DMA ports can handle unit-directional and bi-directional flows (copy mode)</li> <li>• Up to 8-word buffer for configurable burst transfers</li> <li>• Support of byte-swapping and CRC calculations</li> <li>• Library of Scripts and API is available</li> </ul>
SJC	System JTAG Controllor	System Control Peripherals	<p>The SJC provides JTAG interface, which complies with JTAG TAP standards, to internal logic. The i.MX 6Solo/6DualLite processors use JTAG port for production, testing, and system debugging. In addition, the SJC provides BSR (Boundary Scan Register) standard support, which complies with IEEE1149.1 and IEEE1149.6 standards.</p> <p>The JTAG port must be accessible during platform initial laboratory bring-up, for manufacturing tests and troubleshooting, as well as for software debugging by authorized entities. The i.MX 6Solo/6DualLite SJC incorporates three security modes for protecting against unauthorized accesses. Modes are selected through eFUSE configuration.</p>
SPDIF	Sony Philips Digital Interconnect Format	Multimedia Peripherals	A standard audio file transfer format, developed jointly by the Sony and Phillips corporations. Has Transmitter and Receiver functionality.
SNVS	Secure Non-Volatile Storage	Security	Secure Non-Volatile Storage, including Secure Real Time Clock, Security State Machine, Master Key Control, and Violation/Tamper Detection and reporting.

Block Mnemonic	Block Name	Subsystem	Brief Description
SSI-1 SSI-2 SSI-3	I2S/SSI/AC97 Interface	Connectivity Peripherals	<p>The SSI is a full-duplex synchronous interface, which is used on the AP to provide connectivity with off-chip audio peripherals. The SSI supports a wide variety of protocols (SSI normal, SSI network, I2S, and AC-97), bit depths (up to 24 bits per word), and clock / frame sync options.</p> <p>The SSI has two pairs of 8x24 FIFOs and hardware support for an external DMA controller in order to minimize its impact on system performance. The second pair of FIFOs provides hardware interleaving of a second audio stream that reduces CPU overhead in use cases where two time slots are being used simultaneously.</p>
TEMPMON	Temperature Monitor	System Control Peripherals	<p>The Temperature sensor IP is used for detecting die temperature. The temperature read out does not reflect case or ambient temperature. It reflects the temperature in proximity of the sensor location on the die.</p> <p>Temperature distribution may not be uniformly distributed, therefore the read out value may not be the reflection of the temperature value of the entire die.</p>
TZASC	Trust-Zone Address Space Controller	Security	The TZASC (TZC-380 by ARM) provides security address region control functions required for intended application. It is used on the path to the DRAM controller.
UART-1 UART-2 UART-3 UART-4 UART-5	UART Interface	Connectivity Peripherals	<p>Each of the UARTv2 modules support the following serial data transmit/receive protocols and configurations:</p> <ul style="list-style-type: none"> <li>• 7- or 8-bit data words, 1 or 2 stop bits, programmable parity (even, odd or none)</li> <li>• Programmable baud rates up to 5 Mbps.</li> <li>• 32-byte FIFO on Tx and 32 half-word FIFO on Rx supporting auto-baud</li> <li>• IrDA 1.0 support (up to SIR speed of 115200 bps)</li> <li>• Option to operate as 8-pins full UART, DCE, or DTE</li> </ul>
USBOH3	USB 2.0 High Speed OTG and 3x HS Hosts	Connectivity Peripherals	<p>USBOH3 contains:</p> <ul style="list-style-type: none"> <li>• One high-speed OTG module with integrated HS USB PHY</li> <li>• One high-speed Host module with integrated HS USB PHY</li> <li>• Two identical high-speed Host modules connected to HSIC USB ports.</li> </ul>
VDOA	VDOA	Multimedia Peripherals	Video Data Order Adapter (VDOA): used to re-order video data from the “tiled” order used by the VPU to the conventional raster-scan order needed by the IPU.

**Table 2. i.MX 6Solo/6DualLite Modules List (continued)**

Block Mnemonic	Block Name	Subsystem	Brief Description
VPU	Video Processing Unit	Multimedia Peripherals	A high-performing video processing unit (VPU), which covers many SD-level and HD-level video decoders and SD-level encoders as a multi-standard video codec engine as well as several important video processing, such as rotation and mirroring. See the <i>i.MX 6Solo/6DualLite Reference Manual (IMX6SDLRM)</i> for complete list of VPU's decoding/encoding capabilities.
WDOG-1	Watch Dog	Timer Peripherals	The Watch Dog Timer supports two comparison points during each counting period. Each of the comparison points is configurable to evoke an interrupt to the ARM core, and a second point evokes an external event on the WDOG line.
WDOG-2 (TZ)	Watch Dog (TrustZone)	Timer Peripherals	The TrustZone Watchdog (TZ WDOG) timer module protects against TrustZone starvation by providing a method of escaping normal mode and forcing a switch to the TZ mode. TZ starvation is a situation where the normal OS prevents switching to the TZ mode. Such situation is undesirable as it can compromise the system's security. Once the TZ WDOG module is activated, it must be serviced by TZ software on a periodic basis. If servicing does not take place, the timer times out. Upon a time-out, the TZ WDOG asserts a TZ mapped interrupt that forces switching to the TZ mode. If it is still not served, the TZ WDOG asserts a security violation signal to the CSU. The TZ WDOG module cannot be programmed or deactivated by a normal mode SW.
WEIM	NOR-Flash /PSRAM interface	Connectivity Peripherals	The WEIM NOR-FLASH / PSRAM provides: <ul style="list-style-type: none"> <li>• Support 16-bit (in muxed IO mode only) PSRAM memories (sync and async operating modes), at slow frequency</li> <li>• Support 16-bit (in muxed IO mode only) NOR-Flash memories, at slow frequency</li> <li>• Multiple chip selects</li> </ul>
XTALOSC	Crystal Oscillator I/F	Clocks, Resets, and Power Control	The XTALOSC module enables connectivity to external crystal oscillator device. In a typical application use-case, it is used for 24 MHz oscillator to provide USB required frequency.

### 3.1 Special Signal Considerations

Table 3 lists special signal considerations for the i.MX 6Solo/6DualLite processors. The signal names are listed in alphabetical order.

The package contact assignments can be found in Section 6, “Package Information and Contact Assignments.” Signal descriptions are provided in the *i.MX 6Solo/6DualLite Reference Manual* (IMX6SDLRM).

**Table 3. Special Signal Considerations**

Signal Name	Remarks
CLK1_P/CLK1_N CLK2_P/CLK2_N	<p>Two general purpose differential high speed clock Input/outputs are provided. Any or both of them could be used:</p> <ul style="list-style-type: none"> <li>To feed external reference clock to the PLLs and further to the modules inside SoC, for example as alternate reference clock for PCIe, Video/Audio interfaces, etc.</li> <li>To output internal SoC clock to be used outside the SoC as either reference clock or as a functional clock for peripherals, for example it could be used as an output of the PCIe master clock (root complex use)</li> </ul> <p>See the i.MX 6Solo/6DualLite reference manual for details on the respective clock trees. The clock inputs/outputs are LVDS differential pairs compatible with TIA/EIA-644 standard, the maximum frequency range supported is 0...600 MHz.</p> <p>Alternatively one may use single ended signal to drive CLKx_P input. In this case corresponding CLKx_N input should be tied to the constant voltage level equal 1/2 of the input signal swing. Termination should be provided in case of high frequency signals.</p> <p>See LVDS pad electrical specification for further details.</p> <p>After initialization, the CLKx inputs/outputs could be disabled (if not used). If unused any or both of the CLKx_N/P pairs may remain unconnected.</p>
XTALOSC_RTC_XTALI/ RTC_XTALO	<p>If the user wishes to configure XTALOSC_RTC_XTALI and RTC_XTALO as an RTC oscillator, a 32.768 kHz crystal, (<math>\leq 100\text{ k}\Omega</math> ESR, 10 pF load) should be connected between XTALOSC_RTC_XTALI and RTC_XTALO. Remember that the capacitors implemented on either side of the crystal are about twice the crystal load capacitor. To hit the exact oscillation frequency, the board capacitors need to be reduced to account for board and chip parasitics. The integrated oscillation amplifier is self biasing, but relatively weak. Care must be taken to limit parasitic leakage from XTALOSC_RTC_XTALI and RTC_XTALO to either power or ground (<math>&gt;100\text{ M}\Omega</math>). This will debias the amplifier and cause a reduction of startup margin. Typically XTALOSC_RTC_XTALI and RTC_XTALO should bias to approximately 0.5 V.</p> <p>If it is desired to feed an external low frequency clock into XTALOSC_RTC_XTALI the RTC_XTALO pin must remain unconnected or driven with a complimentary signal. The logic level of this forcing clock must not exceed VDD_SNVS_CAP level and the frequency must be <math>&lt;100\text{ kHz}</math> under typical conditions.</p>
XTALI/XTALO	<p>A 24.0 MHz crystal should be connected between XTALI and XTALO. level and the frequency should be <math>&lt;32\text{ MHz}</math> under typical conditions.</p> <p>See the Hardware Development Guide (IMX6DQ6SDLHDG), Design Checklist chapter, for details on crystal selection. NXP BSP (board support package) software requires 24 MHz on XTALI/XTALO.</p> <p>The crystal can be eliminated if an external 24 MHz oscillator is available in the system. In this case, XTALI must be directly driven by the external oscillator and XTALO remains unconnected. The XTALI signal level must swing from <math>\sim 0.8 \times \text{NVCC\_PLL\_OUT}</math> to <math>\sim 0.2\text{ V}</math>.</p> <p>If this clock is used as a reference for USB and PCIe, then there are strict frequency tolerance and jitter requirements. See OSC24M chapter and relevant interface specifications chapters for details.</p>

Table 3. Special Signal Considerations (continued)

Signal Name	Remarks
DRAM_VREF	<p>When using DDR_VREF with DDR I/O, the nominal reference voltage must be half of the NVCC_DRAM supply. The user must tie DDR_VREF to a precision external resistor divider. Use a 1 k<math>\Omega</math> 0.5% resistor to GND and a 1 k<math>\Omega</math> 0.5% resistor to NVCC_DRAM. Shunt each resistor with a closely-mounted 0.1 <math>\mu</math>F capacitor.</p> <p>To reduce supply current, a pair of 1.5 k<math>\Omega</math> 0.1% resistors can be used. Using resistors with recommended tolerances ensures the <math>\pm</math> 2% DDR_VREF tolerance (per the DDR3 specification) is maintained when four DDR3 ICs plus the i.MX 6Solo/6DualLite are drawing current on the resistor divider.</p> <p>It is recommended to use regulated power supply for “big” memory configurations (more than eight devices).</p>
ZQPAD	DRAM calibration resistor 240 $\Omega$ 1% used as reference during DRAM output buffer driver calibration should be connected between this pad and GND.
NVCC_LVDS_2P5	The DDR pre-drivers share the NVCC_LVDS_2P5 ball with the LVDS interface. This ball can be shorted to VDD_HIGH_CAP on the circuit board.
VDD_FA FA_ANA	These signals are reserved for NXP manufacturing use only. User must tie both connections to GND.
GPANAIO	Analog output for NXP use only. This output must remain unconnected.
JTAG_nnnn	<p>The JTAG interface is summarized in <a href="#">Table 4</a>. Use of external resistors is unnecessary. However, if external resistors are used, the user must ensure that the on-chip pull-up/down configuration is followed. For example, do not use an external pull down on an input that has on-chip pull-up.</p> <p>JTAG_TDO is configured with a keeper circuit such that the non-connected condition is eliminated if an external pull resistor is not present. An external pull resistor on JTAG_TDO is detrimental and must be avoided.</p> <p>JTAG_MOD is referenced as SJC_MOD in the i.MX 6Solo/6DualLite reference manual. Both names refer to the same signal. JTAG_MOD must be externally connected to GND for normal operation. Termination to GND through an external pull-down resistor (such as 1 k<math>\Omega</math>) is allowed. JTAG_MOD set to hi configures the JTAG interface to mode compliant with IEEE1149.1 standard. JTAG_MOD set to low configures the JTAG interface for common SW debug adding all the system TAPs to the chain.</p>
NC	These signals are No Connect (NC) and must remain unconnected by the user.
SRC_POR_B	This cold reset negative logic input resets all modules and logic in the IC.
ONOFF	In normal mode may be connected to ON/OFF button (De-bouncing provided at this input). Internally this pad is pulled up. Short connection to GND in OFF mode causes internal power management state machine to change state to ON. In ON mode short connection to GND generates interrupt (intended to SW controllable power down). Long above ~5s connection to GND causes “forced” OFF.
TEST_MODE	TEST_MODE is for NXP factory use. This signal is internally connected to an on-chip pull-down device. This signals The user must either be tied to Vss or remain unconnected.
PCIE_REXT	The impedance calibration process requires connection of reference resistor 200 $\Omega$ 1% precision resistor on PCIE_REXT pad to ground.
CSI_REXT	MIPI CSI PHY reference resistor. Use 6.04 K $\Omega$ 1% resistor connected between this pad and GND
DSI_REXT	MIPI DSI PHY reference resistor. Use 6.04 K $\Omega$ 1% resistor connected between this pad and GND

**Table 4. JTAG Controller Interface Summary**

JTAG	I/O Type	On-Chip Termination
JTAG_TCK	Input	47 k $\Omega$ pull-up
JTAG_TMS	Input	47 k $\Omega$ pull-up
JTAG_TDI	Input	47 k $\Omega$ pull-up
JTAG_TDO	3-state output	Keeper
JTAG_TRSTB	Input	47 k $\Omega$ pull-up
JTAG_MOD	Input	100 k $\Omega$ pull-up

## 3.2 Recommended Connections for Unused Analog Interfaces

The recommended connections for unused analog interfaces can be found in the section, “Unused analog interfaces,” of the Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors (IMX6DQ6SDLHDG).

# 4 Electrical Characteristics

This section provides the device and module-level electrical characteristics for the i.MX 6Solo/6DualLite processors.

### 4.1.1 Absolute Maximum Ratings

#### CAUTION

Stresses beyond those listed under [Table 6](#) may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

[Table 6](#) shows the absolute maximum operating ratings.

## 4.1.2 Thermal Resistance

### NOTE

Per JEDEC JESD51-2, the intent of thermal resistance measurements is solely for a thermal performance comparison of one package to another in a standardized environment. This methodology is not meant to and will not predict the performance of a package in an application-specific environment.

<sup>1</sup> Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.

<sup>2</sup> Per JEDEC JESD51-2 with the single layer board horizontal. Thermal test board meets JEDEC specification for the specified package.

<sup>3</sup> Per JEDEC JESD51-6 with the board horizontal.

<sup>4</sup> Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

<sup>5</sup> Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).

<sup>6</sup> Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

### 4.1.3 Operating Ranges

Table 8 provides the operating ranges of the i.MX 6Solo/6DualLite processors. For details on the chip's power structure, see the “Power Management Unit (PMU)” chapter of the *i.MX 6Solo/6DualLite Reference Manual* (IMX6SDLRM).

**Table 8. Operating Ranges**

Junction temperature	T <sub>J</sub>	-40	—	125	°C	See i.MX 6Solo/6DualLite Product Lifetime Usage Estimates Application Note, AN4725, for information on product lifetime for this processor.

<sup>1</sup> Applying the maximum voltage results in maximum power consumption and heat generation. NXP recommends a voltage set point = (Vmin + the supply tolerance). This results in an optimized power/speed ratio.

<sup>2</sup> See the Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors (IMX6DQ6SDLHDG) for bypass capacitors requirements for each of the \*\_CAP supply outputs.

<sup>3</sup> VDD\_ARM\_IN and VDD\_SOC\_IN must be 125 mV higher than the LDO Output Set Point for correct regulator supply voltage.

<sup>4</sup> In LDO enabled mode, the internal LDO output set points must be configured such that the:

- VDD\_ARM LDO output set point does not exceed the VDD\_SOC LDO output set point by more than 100 mV.
- VDD\_SOC LDO output set point is equal to the VDD\_PU LDO output set point.

The VDD\_ARM LDO output set point can be lower than the VDD\_SOC LDO output set point, however, the minimum output set points shown in this table must be maintained.

<sup>5</sup> In LDO enabled mode, the internal LDO output set points must be configured such that the:

- VDD\_ARM LDO output set point does not exceed the VDD\_SOC LDO output set point by more than 100 mV.
- VDD\_SOC LDO output set point is equal to the VDD\_PU LDO output set point.

The VDD\_ARM LDO output set point can be lower than the VDD\_SOC LDO output set point, however, the minimum output set points shown in this table must be maintained.

<sup>6</sup> Run mode: LDO Bypassed is not supported for the 1 GHz option.

<sup>7</sup> In LDO bypassed mode, the external power supply must ensure that VDD\_ARM\_IN does not exceed VDD\_SOC\_IN by more than 100 mV. The VDD\_ARM\_IN supply voltage can be lower than the VDD\_SOC\_IN supply voltage. The minimum voltages shown in this table must be maintained.

<sup>8</sup> When VDD\_SOC\_IN does not supply PCIE\_VP and PCIE\_VPTX, or when the PCIe PHY is not used, then this maximum can be 1.3 V

<sup>9</sup> While setting VDD\_SNVS\_IN voltage with respect to Charging Currents and RTC, refer to Hardware Development Guide for i.MX 6Dual, 6Quad, 6Solo, 6DualLite Families of Applications Processors (IMX6DQ6SDLHDG).

<sup>10</sup> All digital I/O supplies (NVCC\_XXXX) must be powered under normal conditions whether the associated I/O pins are in use or not and associated IO pins need to have a pull-up or pull-down resistor applied to limit any non-connected gate current.

<sup>11</sup> This supply also powers the pre-drivers of the DDR IO pins, hence, it must be always provided, even when LVDS is not used.

#### 4.1.4 External Clock Sources

Each i.MX 6Solo/6DualLite processor has two external input system clocks: a low frequency (RTC\_XTALI) and a high frequency (XTALI).

The RTC\_XTALI is used for low-frequency functions. It supplies the clock for wake-up circuit, power-down real time clock operation, and slow system and watch-dog counters. The clock input can be connected to either external oscillator or a crystal using internal oscillator amplifier. Additionally, there is an internal ring oscillator, which can be used instead of the RTC\_XTALI if accuracy is not important.

#### NOTE

The internal RTC oscillator does not provide an accurate frequency and is affected by process, voltage and temperature variations. NXP strongly recommends using an external crystal as the RTC\_XTALI reference. If the internal oscillator is used instead, careful consideration should be given to the timing implications on all of the SoC modules dependent on this clock.

The system clock input XTALI is used to generate the main system clock. It supplies the PLLs and other peripherals. The system clock input can be connected to either external oscillator or a crystal using internal oscillator amplifier.

Table 9 shows the interface frequency requirements.

**Table 9. External Input Clock Frequency**

Parameter Description	Symbol	Min	Typ	Max	Unit
RTC_XTALI Oscillator <sup>1,2</sup>	$f_{ckil}$	—	32.768 <sup>3</sup> /32.0	—	kHz
XTALI Oscillator <sup>2,4</sup>	$f_{xtal}$	—	24	—	MHz

<sup>1</sup> External oscillator or a crystal with internal oscillator amplifier.

<sup>2</sup> The required frequency stability of this clock source is application dependent. For recommendations, see the Hardware Development Guide for i.MX 6Dual, 6Quad, 6Solo, 6DualLite Families of Applications Processors (IMX6DQ6SDLHDG).

<sup>3</sup> Recommended nominal frequency 32.768 kHz.

<sup>4</sup> External oscillator or a fundamental frequency crystal with internal oscillator amplifier.

The typical values shown in Table 9 are required for use with NXP BSPs to ensure precise time keeping and USB operation. For XTALOSC\_RTC\_XTALI operation, two clock sources are available.

- On-chip 40 kHz ring oscillator—this clock source has the following characteristics:
  - Approximately 25  $\mu$ A more I<sub>dd</sub> than crystal oscillator
  - Approximately  $\pm 50\%$  tolerance
  - No external component required
  - Starts up quicker than 32 kHz crystal oscillator
- External crystal oscillator with on-chip support circuit:
  - At power up, ring oscillator is utilized. After crystal oscillator is stable, the clock circuit switches over to the crystal oscillator automatically.
  - Higher accuracy than ring oscillator
  - If no external crystal is present, then the ring oscillator is used

The choice of a clock source must be based on real-time clock use and precision timeout.

#### 4.1.5 Maximum Supply Currents

The Power Virus numbers shown in [Table 10](#) represent a use case designed specifically to show the maximum current consumption possible. All cores are running at the defined maximum frequency and are limited to L1 cache accesses only to ensure no pipeline stalls. Although a valid condition, it would have a very limited practical use case, if at all, and be limited to an extremely low duty cycle unless the intention was to specifically show the worst case power consumption.

The NXP power management IC, MMPF0100xxxx, which is targeted for the i.MX 6 series processor family, supports the power consumption shown in [Table 10](#), however a robust thermal design is required for the increased system power dissipation.

See the i.MX 6Solo/6DualLite Power Consumption Measurement Application Note (AN4576) for more details on typical power consumption under various use case definitions.

MISC			
DDR_VREF	—	1	mA

<sup>1</sup> The actual maximum current drawn from VDD\_HIGH\_IN will be as shown plus any additional current drawn from the VDD\_HIGH\_CAP outputs, depending upon actual application configuration (for example, NVCC\_LVDS2P5, NVCC\_MIP1, or HDMI and PCIe VPH supplies).

<sup>2</sup> Under normal operating conditions, the maximum current on VDD\_SNVS\_IN is shown in Table 10. The maximum VDD\_SNVS\_IN current may be higher depending on specific operating configurations, such as BOOT\_MODE[1:0] not equal to 00, or use of the Tamper feature. During initial power on, VDD\_SNVS\_IN can draw up to 1 mA if the supply is capable of sourcing that current. If less than 1 mA is available, the VDD\_SNVS\_CAP charge time will increase.

<sup>3</sup> This is the maximum current per active USB physical interface.

<sup>4</sup> The DRAM power consumption is dependent on several factors, such as external signal termination. DRAM power calculators are typically available from the memory vendors. They take in account factors, such as signal termination. See the i.MX 6Solo/DualLite Power Consumption Measurement Application Note (AN4576) for examples of DRAM power consumption during specific use case scenarios.

<sup>5</sup> General equation for estimated, maximum power consumption of an IO power supply:

$$I_{max} = N \times C \times V \times (0.5 \times F)$$

Where:

N—Number of IO pins supplied by the power line

C—Equivalent external capacitive load

V—IO voltage

(0.5 x F)—Data change rate. Up to 0.5 of the clock rate (F)

In this equation, I<sub>max</sub> is in Amps, C in Farads, V in Volts, and F in Hertz.

<sup>6</sup> NVCC\_LVDS2P5 is supplied by VDD\_HIGH\_CAP (by external connection) so the maximum supply current is included in the current shown for VDD\_HIGH\_IN. The maximum supply current for NVCC\_LVDS2P5 has not been characterized separately.

## 4.1.6 Low Power Mode Supply Currents

## 4.2 Power Supplies Requirements and Restrictions

The system design must comply with power-up sequence, power-down sequence, and steady state guidelines as described in this section to guarantee the reliable operation of the device. Any deviation from these sequences may result in the following situations:

- Excessive current during power-up phase
- Prevention of the device from booting
- Irreversible damage to the processor (worst-case scenario)

## 4.2.1 Power-Up Sequence

The restrictions that follow must be observed:

- VDD\_SNVS\_IN supply must be turned on before any other power supply or be connected (shorted) with VDD\_HIGH\_IN supply.
- If a coin cell is used to power VDD\_SNVS\_IN, then ensure that it is connected before any other supply is switched on.
- The SRC\_POR\_B signal controls the processor POR and must be immediately asserted at power-up and remain asserted until the VDD\_ARM\_CAP, VDD\_SOC\_CAP, and VDD\_PU\_CAP supplies are stable. VDD\_ARM\_IN and VDD\_SOC\_IN may be applied in either order with no restrictions.

### NOTE

Need to ensure that there is no back voltage (leakage) from any supply on the board towards the 3.3 V supply (for example, from the external components that use both the 1.8 V and 3.3 V supplies).

### NOTE

USB\_OTG\_VBUS and USB\_H1\_VBUS are not part of the power supply sequence and may be powered at any time.

## 4.2.2 Power-Down Sequence

No special restrictions for i.MX 6Solo/6DualLite IC.

## 4.2.3 Power Supplies Usage

All I/O pins should not be externally driven while the I/O power supply for the pin (NVCC\_XXX) is OFF. This can cause internal latch-up and malfunctions due to reverse current flows. For information about I/O power supply of each pin, see “Power Rail” columns in pin list tables of [Section 6, “Package Information and Contact Assignments.”](#)

### NOTE

When the PCIE interface is not used, the PCIE\_VP, PCIE\_VPH, and PCIE\_VPTX supplies must be powered or grounded. The input and output supplies for rest of the ports (PCIE\_REXT, PCIE\_RX\_N, PCIE\_RX\_P, PCIE\_TX\_N, and PCIE\_TX\_P) can remain unconnected. It is recommended not to turn the PCIE\_VPH supply OFF while the PCIE\_VP supply is ON, as it may lead to excessive power consumption. If boundary scan test is used, PCIE\_VP, PCIE\_VPH, and PCIE\_VPTX must remain powered.

## 4.3 Integrated LDO Voltage Regulator Parameters

Various internal supplies can be powered ON from internal LDO voltage regulators. All the supply pins named \*\_CAP must be connected to external capacitors. The onboard LDOs are intended for internal use

only and should not be used to power any external circuitry. See the *i.MX 6Solo/6DualLite Reference Manual (IMX6SDLRM)* for details on the power tree scheme.

### NOTE

The \*\_CAP signals must not be powered externally. These signals are intended for internal LDO or LDO bypass operation only.

## 4.3.1 Digital Regulators (LDO\_ARM, LDO\_PU, LDO\_SOC)

There are three digital LDO regulators (“Digital”, because of the logic loads that they drive, not because of their construction). The advantages of the regulators are to reduce the input supply variation because of their input supply ripple rejection and their on-die trimming. This translates into more stable voltage for the on-chip logics.

These regulators have three basic modes:

- Bypass. The regulation FET is switched fully on passing the external voltage, to the load unaltered. The analog part of the regulator is powered down in this state, removing any loss other than the IR drop through the power grid and FET.
- Power Gate. The regulation FET is switched fully off limiting the current draw from the supply. The analog part of the regulator is powered down here limiting the power consumption.
- Analog regulation mode. The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25 mV steps.

For additional information, see the i.MX 6Solo/6DualLite reference manual.

## 4.3.2 Regulators for Analog Modules

### 4.3.2.1 LDO\_1P1

The LDO\_1P1 regulator implements a programmable linear-regulator function from VDD\_HIGH\_IN (see [Table 8](#) for minimum and maximum input requirements). Typical Programming Operating Range is 1.0 V to 1.2 V with the nominal default setting as 1.1 V. The LDO\_1P1 supplies the USB Phy, LVDS Phy, HDMI Phy, MIPI Phy, and PLLs. A programmable brown-out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded to take the necessary steps. Current-limiting can be enabled to allow for in-rush current requirements during start-up, if needed. Active-pull-down can also be enabled for systems requiring this feature.

For information on external capacitor requirements for this regulator, see the Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors (IMX6DQ6SDLHDG).

For additional information, see the i.MX 6Solo/6DualLite reference manual (IMX6SDLRM).

### 4.3.2.2 LDO\_2P5

The LDO\_2P5 module implements a programmable linear-regulator function from VDD\_HIGH\_IN (see [Table 8](#) for minimum and maximum input requirements). Typical Programming Operating Range is 2.25 V to 2.75 V with the nominal default setting as 2.5 V. LDO\_2P5 supplies the USB Phy, LVDS Phy, HDMI Phy, MIPI Phy, E-fuse module, and PLLs. A programmable brown-out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded, to take the necessary steps. Current-limiting can be enabled to allow for in-rush current requirements during start-up, if needed. Active-pull-down can also be enabled for systems requiring this feature. An alternate self-biased low-precision weak-regulator is included that can be enabled for applications needing to keep the output voltage alive during low-power modes where the main regulator driver and its associated global bandgap reference module are disabled. The output of the weak-regulator is not programmable and is a function of the input supply as well as the load current. Typically, with a 3 V input supply the weak-regulator output is 2.525 V and its output impedance is approximately 40  $\Omega$ .

For information on external capacitor requirements for this regulator, see the Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors (IMX6DQ6SDLHDG).

For additional information, see the i.MX 6Solo/6DualLite reference manual.

### 4.3.2.3 LDO\_USB

The LDO\_USB module implements a programmable linear-regulator function from the USB\_OTG\_VBUS and USB\_H1\_VBUS voltages (4.4 V–5.25 V) to produce a nominal 3.0 V output voltage. A programmable brown-out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded, to take the necessary steps. This regulator has a built in power-mux that allows the user to select to run the regulator from either USB\_VBUS supply, when both are present. If only one of the USB\_VBUS voltages is present, then, the regulator automatically selects this supply. Current limit is also included to help the system meet in-rush current targets.

For information on external capacitor requirements for this regulator, see the Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors (IMX6DQ6SDLHDG).

For additional information, see the i.MX 6Solo/6DualLite reference manual.

## 4.5 On-Chip Oscillators

### 4.5.1 OSC24M

This block implements an amplifier that when combined with a suitable quartz crystal and external load capacitors implements an oscillator. The oscillator is powered from NVCC\_PLL\_OUT.

The system crystal oscillator consists of a Pierce-type structure running off the digital supply. A straight forward biased-inverter implementation is used.

### 4.5.2 OSC32K

This block implements an amplifier that when combined with a suitable quartz crystal and external load capacitors implements a low power oscillator. It also implements a power mux such that it can be powered from either a ~3 V backup battery (VDD\_SNVS\_IN) or VDD\_HIGH\_IN such as the oscillator consumes power from VDD\_HIGH\_IN when that supply is available and transitions to the back up battery when VDD\_HIGH\_IN is lost.

In addition, if the clock monitor determines that the OSC32K is not present, then the source of the 32 kHz clock will automatically switch to the internal ring oscillator.

**CAUTION**

The internal RTC oscillator does not provide an accurate frequency and is affected by process, voltage, and temperature variations. NXP strongly recommends using an external crystal as the RTC\_XTALI reference. If the internal oscillator is used instead, careful consideration must be given to the timing implications on all of the SoC modules dependent on this clock.

The OSC32k runs from VDD\_SNVS\_CAP supply, which comes from VDD\_HIGH\_IN/VDD\_SNVS\_IN.

**Table 21. OSC32K Main Characteristics**

Characteristic	Min	Typ	Max	Comments
Fosc	—	32.768 KHz	—	This frequency is nominal and determined mainly by the crystal selected. 32.0 K would work as well.
Current consumption	—	4 $\mu$ A	—	The 4 $\mu$ A is the consumption of the oscillator alone (OSC32k). Total supply consumption will depend on what the digital portion of the RTC consumes. The ring oscillator consumes 1 $\mu$ A when ring oscillator is inactive, 20 $\mu$ A when the ring oscillator is running. Another 1.5 $\mu$ A is drawn from vdd_rtc in the power_detect block. So, the total current is 6.5 $\mu$ A on vdd_rtc when the ring oscillator is not running.
Bias resistor	—	14 M $\Omega$	—	This the integrated bias resistor that sets the amplifier into a high gain state. Any leakage through the ESD network, external board leakage, or even a scope probe that is significant relative to this value will debias the amp. The debiasing will result in low gain, and will impact the circuit's ability to start up and maintain oscillations.
<b>Crystal Properties</b>				
Cload	—	10 pF	—	Usually crystals can be purchased tuned for different Cloads. This Cload value is typically 1/2 of the capacitances realized on the PCB on either side of the quartz. A higher Cload will decrease oscillation margin, but increases current oscillating through the crystal.
ESR	—	50 k $\Omega$	100 k $\Omega$	Equivalent series resistance of the crystal. Choosing a crystal with a higher value will decrease the oscillating margin.

## 4.6 I/O DC Parameters

This section includes the DC parameters of the following I/O types:

- General Purpose I/O (GPIO)
- Double Data Rate I/O (DDR) for LPDDR2 and DDR3 modes
- LVDS I/O
- MLB I/O

**NOTE**

The term 'OVDD' in this section refers to the associated supply rail of an input or output.

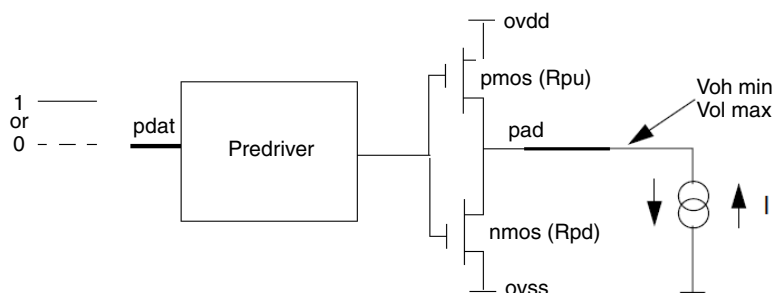

Figure 4. Circuit for Parameters Voh and Vol for I/O Cells

#### 4.6.1 XTALI and RTC\_XTALI (Clock Inputs) DC Parameters

Table 22 shows the DC parameters for the clock inputs.

Table 22. XTALI and RTC\_XTALI DC Parameters

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
XTALI high-level DC input voltage	Vih	—	0.8 x NVCC_PLL	—	NVCC_PLL	V
XTALI low-level DC input voltage	Vil	—	0	—	0.2V	V
RTC_XTALI high-level DC input voltage	Vih	—	0.8	—	1.1 <sup>1</sup>	V
RTC_XTALI low-level DC input voltage	Vil	—	0	—	0.2	V
Input capacitance	C <sub>IN</sub>	Simulated data	—	5	—	pF
Startup current	I <sub>XTALI_STARTUP</sub>	Power-on startup for 0.15msec with a driven 32KHz RTC clock @ 1.1V. This current draw is present even if an external clock source directly drives XTALI	—	—	600	μA
DC input current	I <sub>XTALI_DC</sub>	—	—	—	2.5	μA

<sup>1</sup> This voltage specification must not be exceeded and, as such, is an absolute maximum specification.

#### NOTE

The Vil and Vih specifications only apply when an external clock source is used. If a crystal is used, Vil and Vih do not apply.

#### 4.6.2 General Purpose I/O (GPIO) DC Parameters

Table 23 shows DC parameters for GPIO pads. The parameters in Table 23 are guaranteed per the operating ranges in Table 8, unless otherwise noted.

Table 23. GPIO DC Parameters

Parameter	Symbol	Test Conditions	Min	Max	Units
High-level output voltage <sup>1</sup>	V <sub>OH</sub>	I <sub>oh</sub> = -0.1mA (ipp_dse=001,010) I <sub>oh</sub> = -1mA (ipp_dse=011,100,101,110,111)	OVDD-0.15	—	V
Low-level output voltage <sup>1</sup>	V <sub>OL</sub>	I <sub>ol</sub> = 0.1mA (ipp_dse=001,010) I <sub>ol</sub> = 1mA (ipp_dse=011,100,101,110,111)	—	0.15	V
High-Level input voltage <sup>1,2</sup>	V <sub>IH</sub>	—	0.7*OVDD	OVDD	V
Low-Level input voltage <sup>1,2</sup>	V <sub>IL</sub>	—	0	0.3*OVDD	V
Input Hysteresis (OVDD= 1.8V)	VHYS_LowVDD	OVDD=1.8V	250	—	mV
Input Hysteresis (OVDD=3.3V)	VHYS_HighVDD	OVDD=3.3V	250	—	mV
Schmitt trigger VT <sub>+</sub> <sup>2,3</sup>	VTH+	—	0.5*OVDD	—	mV
Schmitt trigger VT <sub>-</sub> <sup>2,3</sup>	VTH-	—	—	0.5*OVDD	mV
Pull-up resistor (22_kΩ PU)	RPU_22K	V <sub>in</sub> =0V	—	212	μA
Pull-up resistor (22_kΩ PU)	RPU_22K	V <sub>in</sub> =OVDD	—	1	μA
Pull-up resistor (47_kΩ PU)	RPU_47K	V <sub>in</sub> =0V	—	100	μA
Pull-up resistor (47_kΩ PU)	RPU_47K	V <sub>in</sub> =OVDD	—	1	μA
Pull-up resistor (100_kΩ PU)	RPU_100K	V <sub>in</sub> =0V	—	48	μA
Pull-up resistor (100_kΩ PU)	RPU_100K	V <sub>in</sub> =OVDD	—	1	μA
Pull-down resistor (100_kΩ PD)	RPD_100K	V <sub>in</sub> =OVDD	—	48	μA
Pull-down resistor (100_kΩ PD)	RPD_100K	V <sub>in</sub> =0V	—	1	μA
Input current (no PU/PD)	I <sub>IN</sub>	V <sub>I</sub> = 0, V <sub>I</sub> = OVDD	-1	1	μA
Keeper Circuit Resistance	R_Keeper	V <sub>I</sub> = 0.3*OVDD, V <sub>I</sub> = 0.7* OVDD	105	175	kΩ

<sup>1</sup> Overshoot and undershoot conditions (transitions above OVDD and below GND) on switching pads must be held below 0.6 V, and the duration of the overshoot/undershoot must not exceed 10% of the system clock cycle. Overshoot/undershoot must be controlled through printed circuit board layout, transmission line impedance matching, signal line termination, or other methods. Non-compliance to this specification may affect device reliability or cause permanent damage to the device.

<sup>2</sup> To maintain a valid level, the transition edge of the input must sustain a constant slew rate (monotonic) from the current DC level through to the target DC level, V<sub>il</sub> or V<sub>ih</sub>. Monotonic input transition time is from 0.1 ns to 1 s.

<sup>3</sup> Hysteresis of 250 mV is guaranteed over all operating conditions when hysteresis is enabled.

### 4.6.3 DDR I/O DC Parameters

The DDR I/O pads support LPDDR2 and DDR3/DDR3L operational modes.

#### 4.6.3.1 LPDDR2 Mode I/O DC Parameters

The LPDDR2 interface mode fully complies with JESD209-2B LPDDR2 JEDEC standard release June, 2009.

## 4.7 I/O AC Parameters

This section includes the AC parameters of the following I/O types:

- General Purpose I/O (GPIO)
- Double Data Rate I/O (DDR) for LPDDR2 and DDR3/DDR3L modes
- LVDS I/O
- MLB I/O

The GPIO and DDR I/O load circuit and output transition time waveforms are shown in [Figure 5](#) and [Figure 6](#).

<sup>1</sup> Note that the JEDEC JESD79\_3C specification supersedes any specification in this document.

<sup>2</sup> Vid(ac) specifies the input differential voltage | V<sub>tr</sub>-V<sub>cp</sub> | required for switching, where V<sub>tr</sub> is the “true” input signal and V<sub>cp</sub> is the “complementary” input signal. The Minimum value is equal to V<sub>ih</sub>(ac) - V<sub>il</sub>(ac).

<sup>3</sup> The typical value of V<sub>ix</sub>(ac) is expected to be about 0.5 x OVDD. and V<sub>ix</sub>(ac) is expected to track variation of OVDD. V<sub>ix</sub>(ac) indicates the voltage at which differential input signal must cross.

<sup>4</sup> Extended range for V<sub>ix</sub> is only allowed for the clock and when the single-ended clock input signals CK and CK# are:

- monotonic with a single-ended swing V<sub>SEL</sub>/V<sub>SEH</sub> of at least VDD/2 ± 250 mV, and
- the differential slew rate of CK - CK# is larger than 3 V/ns

### 4.7.3 LVDS I/O AC Parameters

The differential output transition time waveform is shown in [Figure 7](#).

**Figure 7. Differential LVDS Driver Transition Time Waveform**

## Electrical Characteristics

A 4-stage pipeline is utilized in the MLB 6-pin implementation in order to facilitate design, maximize throughput, and allow for reasonable PCB trace lengths. Each cycle is one `ipp_clk_in*` (internal clock from MLB PLL) clock period. Cycles 2, 3, and 4 are MLB PHY related. Cycle 2 includes clock-to-output delay of Signal/Data sampling flip-flop and Transmitter, Cycle 3 includes clock-to-output delay of Signal/Data clocked receiver, Cycle 4 includes clock-to-output delay of Signal/Data sampling flip-flop.

MLB 6-pin pipeline diagram is shown in [Figure 9](#).

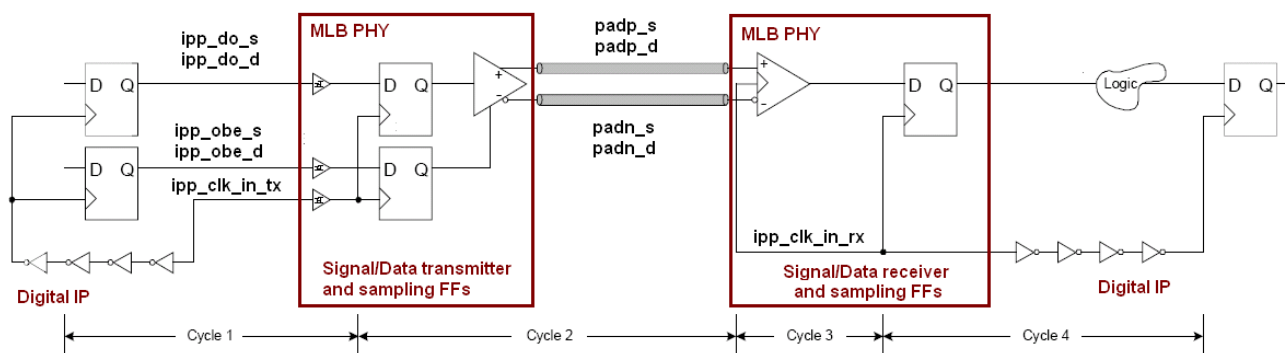

Figure 9. MLB 6-Pin Pipeline Diagram

[Table 33](#) shows the AC parameters for MLB I/O.

Table 33. I/O AC Parameters of MLB PHY

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit

MLB external clock Operating Frequency	fclk_ext	—	—	—	102.4	MHz
MLB PLL clock Operating Frequency	fclk_pll	—	—	—	307.2	MHz

<sup>1</sup>  $t_{SKD} = |t_{PHLD} - t_{PLHD}|$ , is the magnitude difference in differential propagation delay time between the positive going edge and the negative going edge of the same channel.

<sup>2</sup> Measurement levels are 20-80% from output voltage.

## 4.8 Output Buffer Impedance Parameters

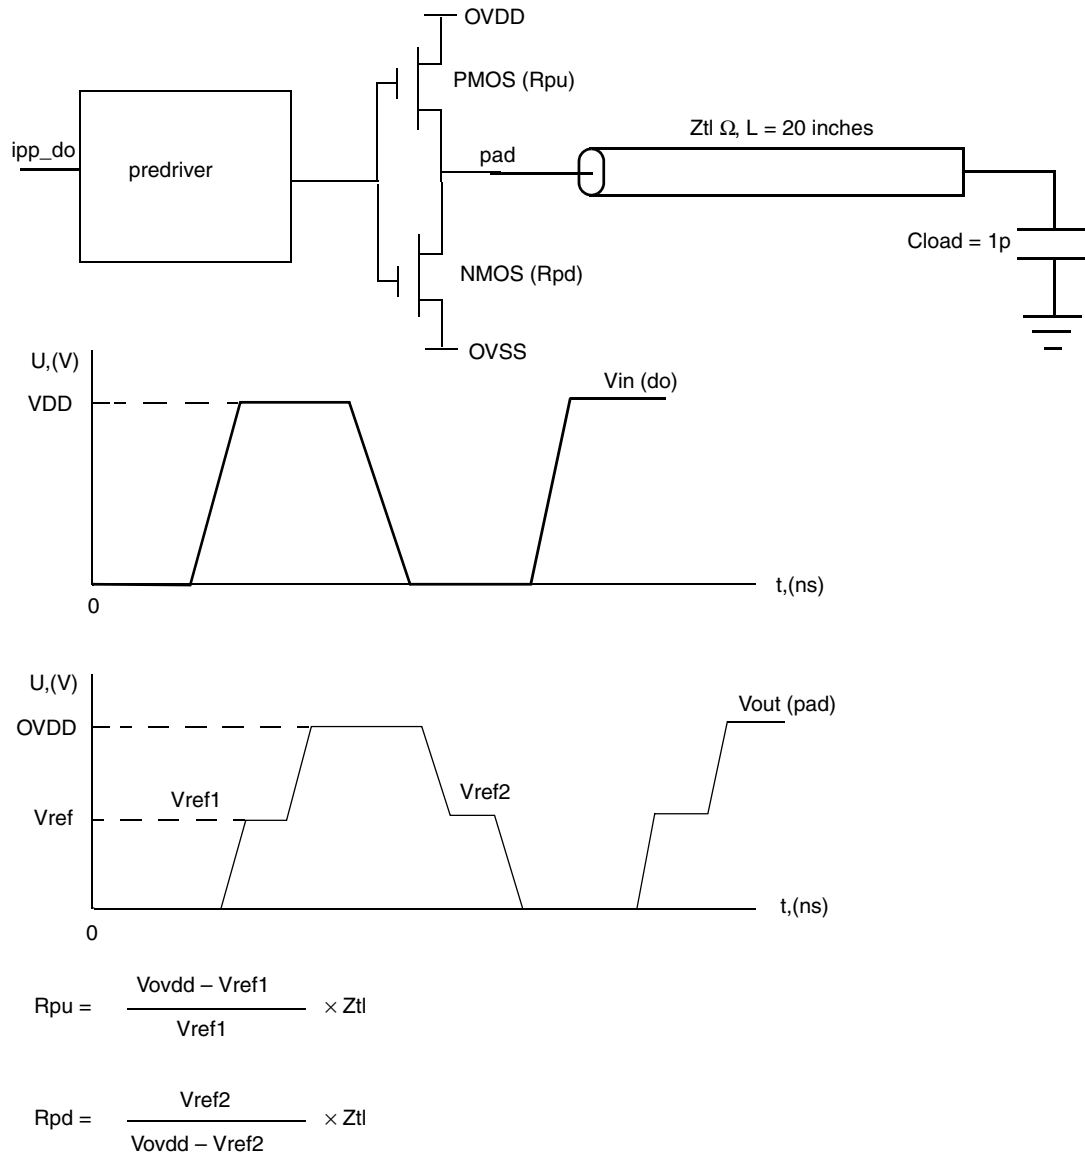

This section defines the I/O impedance parameters of the i.MX 6Solo/6DualLite processors for the following I/O types:

- General Purpose I/O (GPIO)
- Double Data Rate I/O (DDR) for LPDDR2, and DDR3/DDR3L modes
- LVDS I/O
- MLB I/O

**NOTE**

GPIO and DDR I/O output driver impedance is measured with “long” transmission line of impedance  $Z_{tl}$  attached to I/O pad and incident wave launched into transmission line.  $R_{pu}/R_{pd}$  and  $Z_{tl}$  form a voltage divider that defines specific voltage of incident wave relative to OVDD. Output driver impedance is calculated from this voltage divider (see [Figure 10](#)).

**Figure 10. Impedance Matching Load for Measurement**

### 4.8.1 GPIO Output Buffer Impedance

Table 34 shows the GPIO output buffer impedance (OVDD 1.8 V).

**Table 34. GPIO Output Buffer Average Impedance (OVDD 1.8 V)**

Parameter	Symbol	Drive Strength (DSE)	Typ Value	Unit
Output Driver Impedance	Rdrv	001	260	$\Omega$

		011	90	
		100	60	
		101	50	
		110	40	
		111	33	

Table 35 shows the GPIO output buffer impedance (OVDD 3.3 V).

**Table 35. GPIO Output Buffer Average Impedance (OVDD 3.3 V)**

Parameter	Symbol	Drive Strength (DSE)	Typ Value	Unit
Output Driver Impedance	Rdrv	001	150	$\Omega$
		010	75	
		011	50	
		100	37	
		101	30	
		110	25	
		111	20	

### 4.8.2 DDR I/O Output Buffer Impedance

The LPDDR2 interface fully complies with JESD209-2B LPDDR2 JEDEC standard release June, 2009. The DDR3 interface fully complies with JESD79-3D DDR3 JEDEC standard release April, 2008.

Table 36 shows DDR I/O output buffer impedance of i.MX 6Solo/6DualLite processors.

**Table 36. DDR I/O Output Buffer Impedance**

Parameter	Symbol	Test Conditions DSE (Drive Strength)	Typical		Unit
			NVCC_DRAM=1.5 V (DDR3) DDR_SEL=11	NVCC_DRAM=1.2 V (LPDDR2) DDR_SEL=10	
Output Driver Impedance	Rdrv	000	Hi-Z	Hi-Z	$\Omega$
		001	240	240	
		010	120	120	
		011	80	80	
		100	60	60	
		101	48	48	
		110	40	40	
		111	34	34	

**Note:**

1. Output driver impedance is controlled across PVTs using ZQ calibration procedure.
2. Calibration is done against 240  $\Omega$  external reference resistor.
3. Output driver impedance deviation (calibration accuracy) is  $\pm 5\%$  (max/min impedance) across PVTs.

### 4.8.3 LVDS I/O Output Buffer Impedance

The LVDS interface complies with TIA/EIA 644-A standard. See, TIA/EIA STANDARD 644-A, “Electrical Characteristics of Low Voltage Differential Signaling (LVDS) Interface Circuits” for details.

### 4.8.4 MLB I/O Differential Output Impedance

Table 37 shows MLB I/O differential output impedance of the i.MX 6Solo/6DualLite processors.

## 4.9 System Modules Timing

This section contains the timing and electrical parameters for the modules in each i.MX 6Solo/6DualLite processor.

### 4.9.1 Reset Timings Parameters

Figure 11 shows the reset timing and Table 38 lists the timing parameters.

Table 39. WDOG1\_B Timing Parameters

ID	Parameter	Min	Max	Unit
CC3	Duration of WDOG1_B Assertion	1	—	XTALOSC_RTC_XTALI cycle

**NOTE**

XTALOSC\_RTC\_XTALI is approximately 32 kHz.

XTALOSC\_RTC\_XTALI cycle is one period or approximately 30  $\mu$ s.

**NOTE**

WDOG1\_B output signals (for each one of the Watchdog modules) do not have dedicated pins, but are muxed out through the IOMUX. See the IOMUX manual for detailed information.

### 4.9.3 External Interface Module (EIM)

The following subsections provide information on the EIM. Maximum operating frequency for EIM data transfer is 104 MHz. Two system clocks are used with the EIM:

- **ACLK\_EIM\_SLOW\_CLK\_ROOT** is used to clock the EIM module.  
The maximum frequency for **CLK\_EIM\_SLOW\_CLK\_ROOT** is 132 MHz.
- **ACLK\_EXSC** is also used when the EIM is in synchronous mode.  
The maximum frequency for **ACLK\_EXSC** is 104 MHz.

Timing parameters in this section that are given as a function of register settings.

#### 4.9.3.1 EIM Interface Pads Allocation

EIM supports 32-bit, 16-bit and 8-bit devices operating in address/data separate or multiplexed modes. [Table 40](#) provides EIM interface pads allocation in different modes.

<sup>1</sup>  $t$  is the maximum EIM logic (ACLK\_EXSC) cycle time. The maximum allowed axi\_clk frequency depends on the fixed/non-fixed latency configuration, whereas the maximum allowed EIM\_BCLK frequency is:

- Fixed latency for both read and write is 104 MHz.
- Variable latency for read only is 104 MHz.
- Variable latency for write only is 52 MHz.

In variable latency configuration for write, if BCD = 0 & WBCDD = 1 or BCD = 1, axi\_clk must be 104 MHz. Write BCD = 1 and 104 MHz ACLK\_EXSC, will result in a EIM\_BCLK of 52 MHz. When the clock branch to EIM is decreased to 104 MHz, other buses are impacted which are clocked from this source. See the CCM chapter of the *i.MX 6Solo/6DualLite Reference Manual (IMX6SDLRM)* for a detailed clock tree description.

<sup>2</sup> EIM\_BCLK parameters are being measured from the 50% point, that is, high is defined as 50% of signal value and low is defined as 50% as signal value.

<sup>3</sup> For signal measurements, “High” is defined as 80% of signal value and “Low” is defined as 20% of signal value.

Figure 15 to Figure 18 provide few examples of basic EIM accesses to external memory devices with the timing parameters mentioned previously for specific control parameters settings.

#### 4.9.3.4 General EIM Timing-Asynchronous Mode

Figure 19 through Figure 23, and Table 42 help you determine timing parameters relative to the chip select (CS) state for asynchronous and DTACK EIM accesses with corresponding EIM bit fields and the timing parameters mentioned above.

Asynchronous read & write access length in cycles may vary from what is shown in Figure 19 through Figure 22 as RWSC, OEN and CSN is configured differently. See the *i.MX 6Solo/6DualLite Reference Manual (IMX6SDLRM)* for the EIM programming model.

## 4.9.4 Multi-Mode DDR Controller (MMDC)

The Multi-Mode DDR Controller is a dedicated interface to DDR3/DDR3L/LPDDR2 SDRAM.

### 4.9.4.1 MMDC compatibility with JEDEC-compliant SDRAMs

The i.MX 6Solo/6DualLite MMDC supports the following memory types:

- LPDDR2 SDRAM compliant to JESD209-2B LPDDR2 JEDEC standard release June, 2009
- DDR3/DDR3L SDRAM compliant to JESD79-3D DDR3 JEDEC standard release April, 2008

MMDC operation with the standards stated above is contingent upon the board DDR design adherence to the DDR design and layout requirements stated in the *Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors* (IMX6DQ6SDLHDG).

### 4.9.4.2 MMDC Supported DDR3/DDR3L/LPDDR2 Configurations

Table 43 and Table 44 show the supported DDR3/DDR3L/LPDDR2 configurations.

## 4.10 General-Purpose Media Interface (GPMI) Timing

The i.MX 6Solo/6DualLite GPMI controller is a flexible interface NAND Flash controller with 8-bit data width, up to 200 MB/s I/O speed and individual chip select.

It supports Asynchronous timing mode, Source Synchronous timing mode and Samsung Toggle timing mode separately described in the following subsections.

### 4.10.1 Asynchronous Mode AC Timing (ONFI 1.0 Compatible)

Asynchronous mode AC timings are provided as multiplications of the clock cycle and fixed delay. The maximum I/O speed of GPMI in asynchronous mode is about 50 MB/s. [Figure 25](#) through [Figure 28](#) depicts the relative timing between GPMI signals at the module level for different operations under asynchronous mode. [Table 45](#) describes the timing parameters (NF1–NF17) that are shown in the figures.

<sup>1</sup> GPMI's Async Mode output timing can be controlled by the module's internal registers HW\_GPMI\_TIMING0\_ADDRESS\_SETUP, HW\_GPMI\_TIMING0\_DATA\_SETUP, and HW\_GPMI\_TIMING0\_DATA\_HOLD. This AC timing depends on these registers settings. In the table, AS/DS/DH represents each of these settings.

<sup>2</sup> AS minimum value can be 0, while DS/DH minimum value is 1.

<sup>3</sup> T = GPMI clock period -0.075ns (half of maximum p-p jitter).

<sup>4</sup> NF12 is guaranteed by the design.

<sup>5</sup> Non-EDO mode.

<sup>6</sup> EDO mode, GPMI clock  $\approx 100$  MHz  
(AS=DS=DH=1, GPMI\_CTL1 [RDN\_DELAY] = 8, GPMI\_CTL1 [HALF\_PERIOD] = 0).

In EDO mode (Figure 28), NF16/NF17 are different from the definition in non-EDO mode (Figure 27). They are called tREA/tRHOH (RE# access time/RE# HIGH to output hold). The typical value for them are 16 ns (max for tREA)/15 ns (min for tRHOH) at 50 MB/s EDO mode. In EDO mode, GPMI will sample NAND\_DATAxx at rising edge of delayed NAND\_RE\_B provided by an internal DPLL. The delay value can be controlled by GPMI\_CTRL1.RDN\_DELAY (see the GPMI chapter of the i.MX 6Solo/6DualLite reference manual). The typical value of this control register is 0x8 at 50 MT/s EDO mode. But if the board delay is big enough and cannot be ignored, the delay value should be made larger to compensate the board delay.

## 4.10.2 Source Synchronous Mode AC Timing (ONFI 2.x Compatible)

<sup>1</sup> GPMI's source synchronous mode output timing can be controlled by the module's internal registers GPMI\_TIMING2\_CE\_DELAY, GPMI\_TIMING2\_PREAMBLE\_DELAY, GPMI\_TIMING2\_POST\_DELAY. This AC timing depends on these registers settings. In the table, CE\_DELAY/PRE\_DELAY/POST\_DELAY represents each of these settings.

<sup>2</sup> T = tCK(GPMI clock period) - 0.075ns (half of maximum p-p jitter).

For DDR Source sync mode, Figure 33 shows the timing diagram of NAND\_DQS/NAND\_DATAxx read valid window. The typical value of tDQSS is 0.85ns (max) and 1ns (max) for tQHS at 200MB/s. GPMI will sample NAND\_DATA[7:0] at both rising and falling edge of an delayed NAND\_DQS signal, which can be provided by an internal DPLL. The delay value can be controlled by GPMI register GPMI\_READ\_DDR\_DLL\_CTRL.SLV\_DLY\_TARGET (see the GPMI chapter of the i.MX 6Solo/6DualLite reference manual). Generally, the typical delay value of this register is equal to 0x7 which means 1/4 clock cycle delay expected. But if the board delay is big enough and cannot be ignored, the delay value should be made larger to compensate the board delay.

### 4.10.3 Samsung Toggle Mode AC Timing

#### 4.10.3.1 Command and Address Timing

##### NOTE

Samsung Toggle Mode command and address timing is the same as ONFI 1.0 compatible Async mode AC timing. See [Section 4.10.1, “Asynchronous Mode AC Timing \(ONFI 1.0 Compatible\),”](#) for details.

## 4.11 External Peripheral Interface Parameters

The following subsections provide information on external peripheral interfaces.

### 4.11.1 AUDMUX Timing Parameters

The AUDMUX provides a programmable interconnect logic for voice, audio, and data routing between internal serial interfaces (SSIs) and external serial interfaces (audio and voice codecs). The AC timing of AUDMUX external pins is governed by the SSI module. For more information, see the respective SSI electrical specifications found within this document.

### 4.11.2 ECSPI Timing Parameters

This section describes the timing parameters of the ECSPI blocks. The ECSPI have separate timing parameters for master and slave modes.

### 4.11.2.1 ECSPi Master Mode Timing

Figure 36 depicts the timing of ECSPi in master mode. Table 48 lists the ECSPi master mode timing characteristics.

Note: ECSPi\_MOSI is always driven (not tri-stated) between actual data transmissions. This limits the ECSPi to be connected between a single master and a single slave.

**Figure 36. ECSPi Master Mode Timing Diagram**

<sup>1</sup> See specific I/O AC parameters [Section 4.7, “I/O AC Parameters.”](#)

<sup>2</sup> SPI\_RDY is sampled internally by ipg\_clk and is asynchronous to all other CSPI signals.

### 4.11.2.2 ECSPi Slave Mode Timing

Figure 37 depicts the timing of ECSPi in slave mode. Table 49 lists the ECSPi slave mode timing characteristics.

Note: ECSPi\_MISO is always driven (not tri-stated) between actual data transmissions. This limits the ECSPi to be connected between a single master and a single slave.

- <sup>1</sup> i ck = internal clock  
x ck = external clock  
i ck a = internal clock, asynchronous mode  
(asynchronous implies that ESAI\_TX\_CLK and ESAI\_RX\_CLK are two different clocks)  
i ck s = internal clock, synchronous mode  
(synchronous implies that ESAI\_TX\_CLK and ESAI\_RX\_CLK are the same clock)

- <sup>2</sup> bl = bit length  
wl = word length  
wr = word length relative

- <sup>3</sup> ESAI\_TX\_CLK(SCKT pin) = transmit clock  
ESAI\_RX\_CLK(SCKR pin) = receive clock  
ESAI\_TX\_FS(FST pin) = transmit frame sync  
ESAI\_RX\_FS(FSR pin) = receive frame sync  
ESAI\_TX\_HF\_CLK(HCKT pin) = transmit high frequency clock  
ESAI\_RX\_HF\_CLK(HCKR pin) = receive high frequency clock

- <sup>4</sup> For the internal clock, the external clock cycle is defined by  $I_{cyc}$  and the ESAI control register.

- <sup>5</sup> The word-relative frame sync signal waveform relative to the clock operates in the same manner as the bit-length frame sync signal waveform, but it spreads from one serial clock before the first bit clock (like the bit length frame sync signal), until the second-to-last bit clock of the first word in the frame.

## 4.11.4 Ultra High Speed SD/SDIO/MMC Host Interface (uSDHC) AC Timing

This section describes the electrical information of the uSDHC, which includes SD/eMMC4.3 (Single Data Rate) timing, eMMC4.4/4.41 (Dual Data Rate) timing and SDR104/50(SD3.0) timing.

### 4.11.4.1 SD/eMMC4.3 (Single Data Rate) AC Timing

Figure 40 depicts the timing of SD/eMMC4.3, and Table 51 lists the SD/eMMC4.3 timing characteristics.

<sup>1</sup> In low speed mode, card clock must be lower than 400 kHz, voltage ranges from 2.7 to 3.6 V.

<sup>2</sup> In normal (full) speed mode for SD/SDIO card, clock frequency can be any value between 0–25 MHz. In high-speed mode, clock frequency can be any value between 0–50 MHz.

<sup>3</sup> In normal (full) speed mode for MMC card, clock frequency can be any value between 0–20 MHz. In high-speed mode, clock frequency can be any value between 0–52 MHz.

<sup>4</sup> To satisfy hold timing, the delay difference between clock input and cmd/data input must not exceed 2 ns.

#### 4.11.4.2 eMMC4.4/4.41 (Dual Data Rate) AC Timing

Figure 41 depicts the timing of eMMC4.4/4.41. Table 52 lists the eMMC4.4/4.41 timing characteristics. Be aware that only DATA is sampled on both edges of the clock (not applicable to CMD).

<sup>1</sup>Data window in SDR100 mode is variable.

### 4.11.4.4 Bus Operation Condition for 3.3 V and 1.8 V Signaling

Signaling level of SD/eMMC4.3 and eMMC4.4/4.41 modes is 3.3 V. Signaling level of SDR104/SDR50 mode is 1.8 V. The DC parameters for the NVCC\_SD1, NVCC\_SD2 and NVCC\_SD3 supplies are identical to those shown in Table 23, "GPIO DC Parameters," on page 41.

### 4.11.5 Ethernet Controller (ENET) AC Electrical Specifications

The following timing specs are defined at the chip I/O pin and must be translated appropriately to arrive at timing specs/constraints for the physical interface.

#### 4.11.5.1 ENET MII Mode Timing

This subsection describes MII receive, transmit, asynchronous inputs, and serial management signal timings.

##### 4.11.5.1.1 MII Receive Signal Timing (ENET\_RX\_DATA3,2,1,0, ENET\_RX\_EN, ENET\_RX\_ER, and ENET\_RX\_CLK)

The receiver functions correctly up to an ENET\_RX\_CLK maximum frequency of 25 MHz + 1%. There is no minimum frequency requirement. Additionally, the processor clock frequency must exceed twice the ENET\_RX\_CLK frequency.

Figure 43 shows MII receive signal timings. Table 54 describes the timing parameters (M1–M4) shown in the figure.

Figure 43. MII Receive Signal Timing Diagram

Table 54. MII Receive Signal Timing

ID	Characteristic <sup>1</sup>	Min	Max	Unit
M1	ENET_RX_DATA3,2,1,0, ENET_RX_EN, ENET_RX_ER to ENET_RX_CLK setup	5	—	ns
M2	ENET_RX_CLK to ENET_RX_DATA3,2,1,0, ENET_RX_EN, ENET_RX_ER hold	5	—	ns
M3	ENET_RX_CLK pulse width high	35%	65%	ENET_RX_CLK period
M4	ENET_RX_CLK pulse width low	35%	65%	ENET_RX_CLK period

<sup>1</sup> ENET\_RX\_EN, ENET\_RX\_CLK, and ENET0\_RXD0 have the same timing in 10 Mbps 7-wire interface mode.

#### 4.11.5.1.2 MII Transmit Signal Timing (ENET\_TX\_DATA3,2,1,0, ENET\_TX\_EN, ENET\_TX\_ER, and ENET\_TX\_CLK)

The transmitter functions correctly up to an ENET\_TX\_CLK maximum frequency of 25 MHz + 1%. There is no minimum frequency requirement. Additionally, the processor clock frequency must exceed twice the ENET\_TX\_CLK frequency.

Figure 44 shows MII transmit signal timings. Table 55 describes the timing parameters (M5–M8) shown in the figure.

Figure 44. MII Transmit Signal Timing Diagram

Table 55. MII Transmit Signal Timing

ID	Characteristic <sup>1</sup>	Min	Max	Unit
M5	ENET_TX_CLK to ENET_TX_DATA3,2,1,0, ENET_TX_EN, ENET_TX_ER invalid	5	—	ns
M6	ENET_TX_CLK to ENET_TX_DATA3,2,1,0, ENET_TX_EN, ENET_TX_ER valid	—	20	ns
M7	ENET_TX_CLK pulse width high	35%	65%	ENET_TX_CLK period
M8	ENET_TX_CLK pulse width low	35%	65%	ENET_TX_CLK period

<sup>1</sup> ENET\_TX\_EN, ENET\_TX\_CLK, and ENET0\_TXD0 have the same timing in 10-Mbps 7-wire interface mode.

#### 4.11.5.1.3 MII Asynchronous Inputs Signal Timing (ENET\_CRS and ENET\_COL)

Figure 45 shows MII asynchronous input timings. Table 56 describes the timing parameter (M9) shown in the figure.

Figure 45. MII Async Inputs Timing Diagram

**Table 56. MII Asynchronous Inputs Signal Timing**

ID	Characteristic	Min	Max	Unit
M9 <sup>1</sup>	ENET_CRS to ENET_COL minimum pulse width	1.5	—	ENET_TX_CLK period

<sup>1</sup> ENET\_COL has the same timing in 10-Mbit 7-wire interface mode.

#### 4.11.5.1.4 MII Serial Management Channel Timing (ENET\_MDIO and ENET\_MDC)

The MDC frequency is designed to be equal to or less than 2.5 MHz to be compatible with the IEEE 802.3 MII specification. However the ENET can function correctly with a maximum MDC frequency of 15 MHz.

Figure 46 shows MII asynchronous input timings. Table 57 describes the timing parameters (M10–M15) shown in the figure.

**Figure 46. MII Serial Management Channel Timing Diagram****Table 57. MII Serial Management Channel Timing**

ID	Characteristic	Min	Max	Unit
M10	ENET_MDC falling edge to ENET_MDIO output invalid (min. propagation delay)	0	—	ns
M11	ENET_MDC falling edge to ENET_MDIO output valid (max. propagation delay)	—	5	ns
M12	ENET_MDIO (input) to ENET_MDC rising edge setup	18	—	ns
M13	ENET_MDIO (input) to ENET_MDC rising edge hold	0	—	ns
M14	ENET_MDC pulse width high	40%	60%	ENET_MDC period
M15	ENET_MDC pulse width low	40%	60%	ENET_MDC period

### 4.11.5.2 RMII Mode Timing

In RMII mode, ENET\_CLK is used as the REF\_CLK, which is a 50 MHz  $\pm$  50 ppm continuous reference clock. ENET\_RX\_EN is used as the ENET\_RX\_EN in RMII. Other signals under RMII mode include ENET\_TX\_EN, ENET\_TX\_DATA[1:0], ENET\_RX\_DATA[1:0] and ENET\_RX\_ER.

Figure 47 shows RMII mode timings. Table 58 describes the timing parameters (M16–M21) shown in the figure.

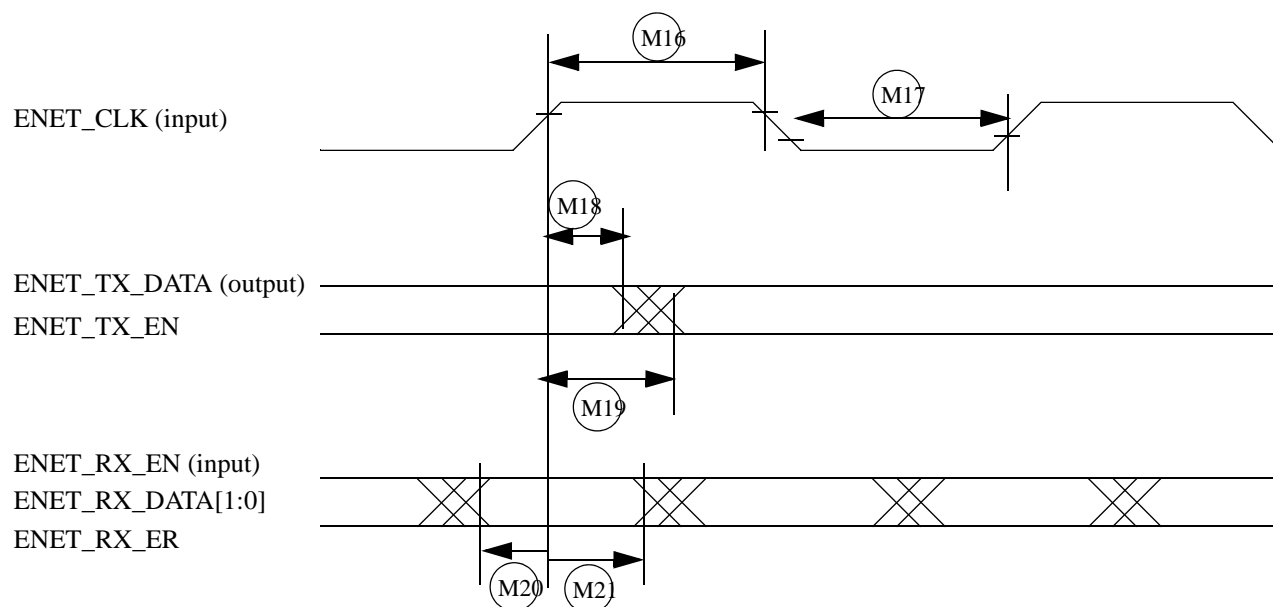

Figure 47. RMII Mode Signal Timing Diagram

Table 58. RMII Signal Timing

ID	Characteristic	Min	Max	Unit
M16	ENET_CLK pulse width high	35%	65%	ENET_CLK period
M17	ENET_CLK pulse width low	35%	65%	ENET_CLK period
M18	ENET_CLK to ENET0_TXD[1:0], ENET_TX_DATA invalid	4	—	ns
M19	ENET_CLK to ENET0_TXD[1:0], ENET_TX_DATA valid	—	15	ns
M20	ENET_RX_DATA[1:0], ENET_RX_EN(ENET_RX_EN), ENET_RX_ER to ENET_CLK setup	4	—	ns
M21	ENET_CLK to ENET_RX_DATA[1:0], ENET_RX_EN, ENET_RX_ER hold	2	—	ns

### 4.11.5.3 Signal Switching Specifications

The following timing specifications meet the requirements for RGMII interfaces for a range of transceiver devices.

**Table 59. RGMII Signal Switching Specifications<sup>1</sup>**

Symbol	Description	Min	Max	Unit
$T_{cyc}^2$	Clock cycle duration	7.2	8.8	ns
$T_{skewT}^3$	Data to clock output skew at transmitter	-500	500	ps
$T_{skewR}^3$	Data to clock input skew at receiver	1	2.6	ns
Duty_G <sup>4</sup>	Duty cycle for Gigabit	45	55	%
Duty_T <sup>4</sup>	Duty cycle for 10/100T	40	60	%
Tr/Tf	Rise/fall time (20–80%)	—	0.75	ns

<sup>1</sup> The timings assume the following configuration:

DDR\_SEL = (11)b

DSE (drive-strength) = (111)b

<sup>2</sup> For 10 Mbps and 100 Mbps,  $T_{cyc}$  will scale to 400 ns  $\pm$  40 ns and 40 ns  $\pm$  4 ns respectively.

<sup>3</sup> For all versions of RGMII prior to 2.0; This implies that PC board design will require clocks to be routed such that an additional trace delay of greater than 1.5 ns and less than 2.0 ns will be added to the associated clock signal. For 10/100, the Max value is unspecified.

<sup>4</sup> Duty cycle may be stretched/shrunk during speed changes or while transitioning to a received packet's clock domain as long as minimum duty cycle is not violated and stretching occurs for no more than three  $T_{cyc}$  of the lowest speed transitioned between.

### 4.11.6 Flexible Controller Area Network (FLEXCAN) AC Electrical Specifications

The Flexible Controller Area Network (FlexCAN) module is a communication controller implementing the CAN protocol according to the CAN 2.0B protocol specification. The processor has two CAN modules available for systems design. Tx and Rx ports for both modules are multiplexed with other I/O pins. See the IOMUXC chapter of the *i.MX 6Solo/6DualLite Reference Manual (IMX6SDLRM)* to see which pins expose Tx and Rx pins; these ports are named FLEXCAN\_TX and FLEXCAN\_RX, respectively.

### 4.11.7 HDMI Module Timing Parameters

#### 4.11.7.1 Latencies and Timing Information

Power-up time (time between TX\_PWRON assertion and TX\_READY assertion) for the HDMI 3D Tx PHY while operating with the slowest input reference clock supported (13.5 MHz) is 3.35 ms.

Power-up time for the HDMI 3D Tx PHY while operating with the fastest input reference clock supported (340 MHz) is 133  $\mu$ s.

#### 4.11.7.2 Electrical Characteristics

The table below provides electrical characteristics for the HDMI 3D Tx PHY. The following three figures illustrate various definitions and measurement conditions specified in the table below.

### 4.11.9 I<sup>2</sup>C Module Timing Parameters

This section describes the timing parameters of the I<sup>2</sup>C module. Figure 59 depicts the timing of I<sup>2</sup>C module, and Table 62 lists the I<sup>2</sup>C module timing characteristics.

Figure 59. I<sup>2</sup>C Bus Timing

Table 62. I<sup>2</sup>C Module Timing Parameters

ID	Parameter	Standard Mode		Fast Mode		Unit
		Min	Max	Min	Max	
IC1	I2Cx_SCL cycle time	10	—	2.5	—	μs
IC2	Hold time (repeated) START condition	4.0	—	0.6	—	μs
IC3	Set-up time for STOP condition	4.0	—	0.6	—	μs
IC4	Data hold time	0 <sup>1</sup>	3.45 <sup>2</sup>	0 <sup>1</sup>	0.9 <sup>2</sup>	μs
IC5	HIGH Period of I2Cx_SCL Clock	4.0	—	0.6	—	μs
IC6	LOW Period of the I2Cx_SCL Clock	4.7	—	1.3	—	μs
IC7	Set-up time for a repeated START condition	4.7	—	0.6	—	μs
IC8	Data set-up time	250	—	100 <sup>3</sup>	—	ns
IC9	Bus free time between a STOP and START condition	4.7	—	1.3	—	μs
IC10	Rise time of both I2Cx_SDA and I2Cx_SCL signals	—	1000	$20 + 0.1C_b^4$	300	ns
IC11	Fall time of both I2Cx_SDA and I2Cx_SCL signals	—	300	$20 + 0.1C_b^4$	300	ns
IC12	Capacitive load for each bus line (C <sub>b</sub> )	—	400	—	400	pF

<sup>1</sup> A device must internally provide a hold time of at least 300 ns for I2Cx\_SDA signal to bridge the undefined region of the falling edge of I2Cx\_SCL.

<sup>2</sup> The maximum hold time has only to be met if the device does not stretch the LOW period (ID no IC5) of the I2Cx\_SCL signal.

<sup>3</sup> A Fast-mode I<sup>2</sup>C-bus device can be used in a Standard-mode I<sup>2</sup>C-bus system, but the requirement of Set-up time (ID No IC7) of 250 ns must be met. This automatically is the case if the device does not stretch the LOW period of the I2Cx\_SCL signal. If such a device does stretch the LOW period of the I2Cx\_SCL signal, it must output the next data bit to the I2Cx\_SDA line  $\text{max\_rise\_time (IC9)} + \text{data\_setup\_time (IC7)} = 1000 + 250 = 1250$  ns (according to the Standard-mode I<sup>2</sup>C-bus specification) before the I2Cx\_SCL line is released.

<sup>4</sup> C<sub>b</sub> = total capacitance of one bus line in pF.

### 4.11.10 Image Processing Unit (IPU) Module Parameters

The purpose of the IPU is to provide comprehensive support for the flow of data from an image sensor and/or to a display device. This support covers all aspects of these activities:

- Connectivity to relevant devices—cameras, displays, graphics accelerators, and TV encoders.
- Related image processing and manipulation: sensor image signal processing, display processing, image conversions, and other related functions.
- Synchronization and control capabilities, such as avoidance of tearing artifacts.

#### 4.11.10.1 IPU Sensor Interface Signal Mapping

The IPU supports a number of sensor input formats. [Table 63](#) defines the mapping of the Sensor Interface Pins used for various supported interface formats.

<sup>3</sup> The two MSB bits are duplicated on LSB bits implementing color extension

<sup>4</sup> YCbCr, 8 bits—Supported within the BT.656 protocol (sync embedded within the data stream).

<sup>5</sup> RGB 16 bits— Supported in two ways: (1) As a “generic data” input, with no on-the-fly processing; (2) With on-the-fly processing, but only under some restrictions on the control protocol.

<sup>6</sup> YCbCr 16 bits— Supported as a “generic-data” input, with no on-the-fly processing.

<sup>7</sup> YCbCr 16 bits— Supported as a sub-case of the YCbCr, 20 bits, under the same conditions (BT.1120 protocol).

<sup>8</sup> YCbCr, 20 bits, supported only within the BT.1120 protocol (syncs embedded within the data stream).

#### 4.11.10.2 Sensor Interface Timings

There are three camera timing modes supported by the IPU.

##### 4.11.10.2.1 BT.656 and BT.1120 Video Mode

Smart camera sensors, which include imaging processing, usually support video mode transfer. They use an embedded timing syntax to replace the IPUx\_CSIx\_VSYNC and IPUx\_CSIx\_HSYNC signals. The timing syntax is defined by the BT.656/BT.1120 standards.

This operation mode follows the recommendations of ITU BT.656/ ITU BT.1120 specifications. The only control signal used is IPUx\_CSIx\_PIX\_CLK. Start-of-frame and active-line signals are embedded in the data stream. An active line starts with a SAV code and ends with a EAV code. In some cases, digital blanking is inserted in between EAV and SAV code. The CSI decodes and filters out the timing-coding from the data stream, thus recovering IPUx\_CSIx\_VSYNC and IPUx\_CSIx\_HSYNC signals for internal use. On BT.656 one component per cycle is received over the IPUx\_CSIx\_DATA\_EN bus. On BT.1120 two components per cycle are received over the IPUx\_CSIx\_DATA\_EN bus.

#### 4.11.10.2.2 Gated Clock Mode

The IPUx\_CSIx\_VSYNC, IPUx\_CSIx\_HSYNC, and IPUx\_CSIx\_PIX\_CLK signals are used in this mode. See [Figure 60](#).

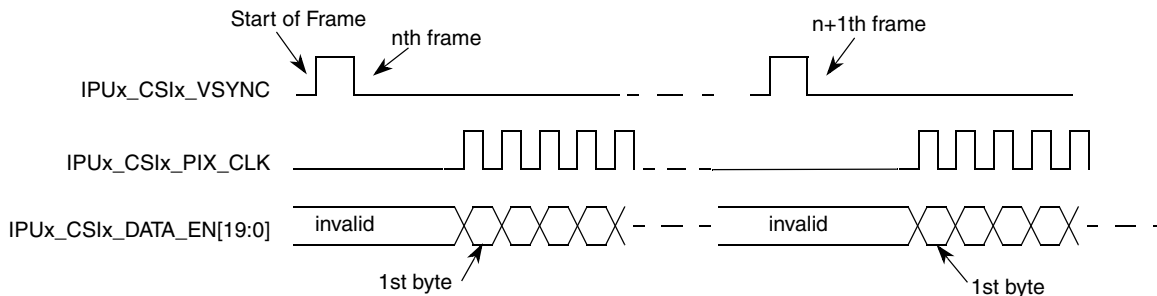

**Figure 60. Gated Clock Mode Timing Diagram**

A frame starts with a rising edge on IPUx\_CSIx\_VSYNC (all the timings correspond to straight polarity of the corresponding signals). Then IPUx\_CSIx\_HSYNC goes to high and hold for the entire line. Pixel clock is valid as long as IPUx\_CSIx\_HSYNC is high. Data is latched at the rising edge of the valid pixel clocks. IPUx\_CSIx\_HSYNC goes to low at the end of line. Pixel clocks then become invalid and the CSI stops receiving data from the stream. For the next line, the IPUx\_CSIx\_HSYNC timing repeats. For the next frame, the IPUx\_CSIx\_VSYNC timing repeats.

#### 4.11.10.2.3 Non-Gated Clock Mode

The timing is the same as the gated-clock mode (described in [Section 4.11.10.2.2, “Gated Clock Mode,”](#)) except for the IPUx\_CSIx\_HSYNC signal, which is not used (see [Figure 61](#)). All incoming pixel clocks are valid and cause data to be latched into the input FIFO. The IPUx\_CSIx\_PIX\_CLK signal is inactive (states low) until valid data is going to be transmitted over the bus.

**Figure 61. Non-Gated Clock Mode Timing Diagram**

The timing described in [Figure 61](#) is that of a typical sensor. Some other sensors may have a slightly different timing. The CSI can be programmed to support rising/falling-edge triggered IPUx\_CSIx\_VSYNC; active-high/low IPUx\_CSIx\_HSYNC; and rising/falling-edge triggered IPUx\_CSIx\_PIX\_CLK.

### 4.11.10.3 Electrical Characteristics

Figure 62 depicts the sensor interface timing. IPU<sub>x</sub>\_CSI<sub>x</sub>\_PIX\_CLK signal described here is not generated by the IPU. Table 64 lists the sensor interface timing characteristics.

<sup>1</sup> Signal mapping (both data and control/synchronization) is flexible. The table provides examples.

<sup>2</sup> Restrictions for ports IPUx\_DISPx\_DAT00 through IPUx\_DISPx\_DAT23 are as follows:

- A maximum of three continuous groups of bits can be independently mapped to the external bus. Groups must not overlap.
- The bit order is expressed in each of the bit groups, for example, B[0] = least significant blue pixel bit.

<sup>3</sup> This mode works in compliance with recommendation ITU-R BT.656. The timing reference signals (frame start, frame end, line start, and line end) are embedded in the 8-bit data bus. Only video data is supported, transmission of non-video related data during blanking intervals is not supported.

## NOTE

Table 65 provides information for both the DISP0 and DISP1 ports.

However, DISP1 port has reduced pinout depending on IOMUXC configuration and therefore may not support all the above configurations.

See the IOMUXC table for details.

### 4.11.10.5 IPU Display Interface Timing

The IPU Display Interface supports two kinds of display accesses: synchronous and asynchronous. There are two groups of external interface pins to provide synchronous and asynchronous controls accordantly.

#### 4.11.10.5.1 Synchronous Controls

The synchronous control changes its value as a function of a system or of an external clock. This control has a permanent period and a permanent wave form.

There are special physical outputs to provide synchronous controls:

- The IPP\_DISP\_CLK is a dedicated base synchronous signal that is used to generate a base display (component, pixel) clock for a display.
- The IPUx\_DIx\_PIN01—IPUx\_DIx\_PIN07 are general purpose synchronous pins, that can be used to provide HSYNC, VSYNC, DRDY or any other independent signal to a display.

The IPU has a system of internal binding counters for internal events (such as, HSYNC/VSYNC) calculation. The internal event (local start point) is synchronized with internal DI\_CLK. A suitable control starts from the local start point with predefined UP and DOWN values to calculate control's changing points with half DI\_CLK resolution. A full description of the counters system can be found in the IPU chapter of the *i.MX 6Solo/6DualLite Reference Manual (IMX6SDLRM)*.

#### 4.11.10.5.2 Asynchronous Controls

The asynchronous control is a data-oriented signal that changes its value with an output data according to additional internal flags coming with the data.

There are special physical outputs to provide asynchronous controls, as follows:

- The IPUx\_DIx\_D0\_CS and IPUx\_DIx\_D1\_CS pins are dedicated to provide chip select signals to two displays.
- The IPUx\_DIx\_PIN11—IPUx\_DIx\_PIN17 are general purpose asynchronous pins, that can be used to provide WR, RD, RS or any other data oriented signal to display.

#### NOTE

The IPU has independent signal generators for asynchronous signals toggling. When a DI decides to put a new asynchronous data in the bus, a new internal start (local start point) is generated. The signals generators calculate predefined UP and DOWN values to change pins states with half DI\_CLK resolution.

#### 4.11.10.6 Synchronous Interfaces to Standard Active Matrix TFT LCD Panels

##### 4.11.10.6.1 IPU Display Operating Signals

The IPU uses four control signals and data to operate a standard synchronous interface:

- IPP\_DISP\_CLK—Clock to display
- HSYNC—Horizontal synchronization
- VSYNC—Vertical synchronization
- DRDY—Active data

All synchronous display controls are generated on the base of an internally generated “local start point”. The synchronous display controls can be placed on time axis with DI's offset, up and down parameters.

The display access can be whole number of DI clock (Tdiclk) only. The IPP\_DATA can not be moved relative to the local start point. The data bus of the synchronous interface is output direction only.

#### 4.11.10.6.2 LCD Interface Functional Description

Figure 63 depicts the LCD interface timing for a generic active matrix color TFT panel. In this figure, signals are shown with negative polarity. The sequence of events for active matrix interface timing is:

- DI\_CLK internal DI clock is used for calculation of other controls.
- IPP\_DISP\_CLK latches data into the panel on its negative edge (when positive polarity is selected). In active mode, IPP\_DISP\_CLK runs continuously.
- HSYNC causes the panel to start a new line. (Usually IPUx\_DIx\_PIN02 is used as HSYNC.)
- VSYNC causes the panel to start a new frame. It always encompasses at least one HSYNC pulse. (Usually IPUx\_DIx\_PIN03 is used as VSYNC.)
- DRDY acts like an output enable signal to the CRT display. This output enables the data to be shifted onto the display. When disabled, the data is invalid and the trace is off. (DRDY can be used either synchronous or asynchronous generic purpose pin as well.)

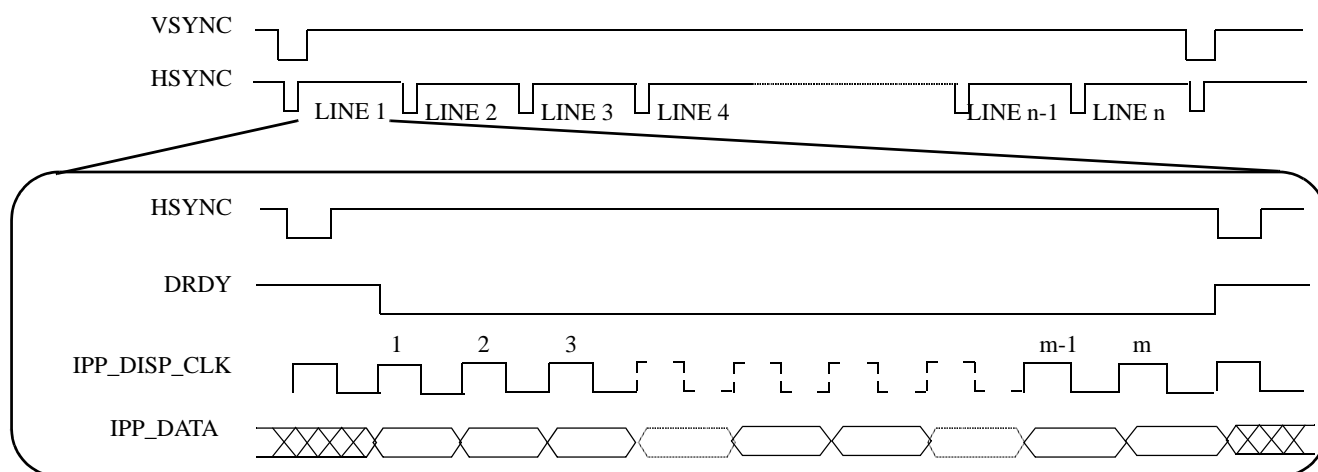

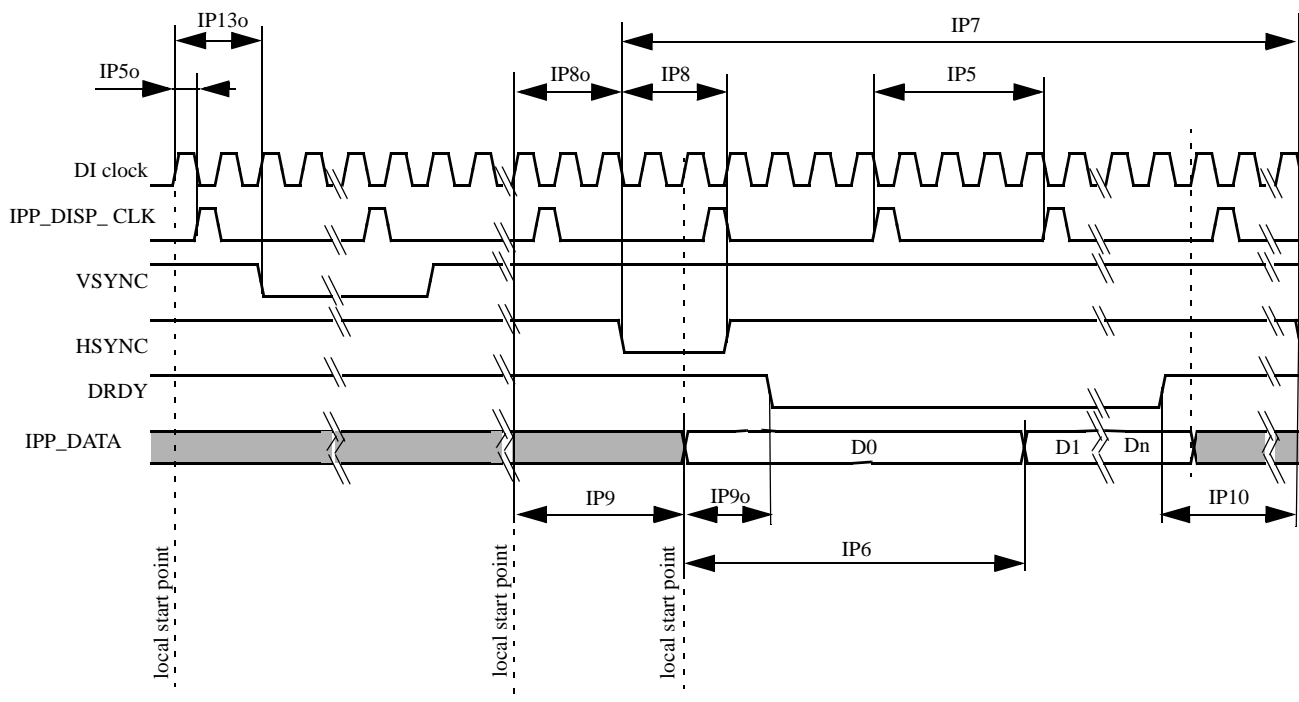

Figure 63. Interface Timing Diagram for TFT (Active Matrix) Panels

#### 4.11.10.6.3 TFT Panel Sync Pulse Timing Diagrams

Figure 64 depicts the horizontal timing (timing of one line), including both the horizontal sync pulse and the data. All the parameters shown in the figure are programmable. All controls are started by

corresponding internal events—local start points. The timing diagrams correspond to inverse polarity of the IPP\_DISP\_CLK signal and active-low polarity of the HSYNC, VSYNC, and DRDY signals.

**Figure 64. TFT Panels Timing Diagram—Horizontal Sync Pulse**

Figure 65 depicts the vertical timing (timing of one frame). All parameters shown in the figure are programmable.

**Figure 65. TFT Panels Timing Diagram—Vertical Sync Pulse**

Table 66 shows timing characteristics of signals presented in Figure 64 and Figure 65.

<sup>1</sup> Display interface clock period immediate value.

DISP\_CLK\_PERIOD—number of DI\_CLK per one Tdicp. Resolution 1/16 of DI\_CLK.

DI\_CLK\_PERIOD—relation of between programing clock frequency and current system clock frequency

Display interface clock period average value.

$$\bar{T}_{dicp} = T_{diclk} \times \frac{DISP\_CLK\_PERIOD}{DI\_CLK\_PERIOD}$$

<sup>2</sup> DI's counter can define offset, period and UP/DOWN characteristic of output signal according to prograded parameters of the counter. Same of parameters in the table are not defined by DI's registers directly (by name), but can be generated by corresponding DI's counter. The SCREEN\_WIDTH is an input value for DI's HSYNC generation counter. The distance between HSYNCs is a SCREEN\_WIDTH.

The maximum accuracy of UP/DOWN edge of controls is:

$$Accuracy = (0.5 \times T_{diclk}) \pm 0.62ns$$

The maximum accuracy of UP/DOWN edge of IPP\_DATA is:

$$Accuracy = T_{diclk} \pm 0.62ns$$

The DISP\_CLK\_PERIOD, DI\_CLK\_PERIOD parameters are programmed through the registers.

Figure 66 depicts the synchronous display interface timing for access level. The DISP\_CLK\_DOWN and DISP\_CLK\_UP parameters are set through the Register. Table 67 lists the synchronous display interface timing characteristics.

#### 4.11.14 MediaLB (MLB) Characteristics

##### 4.11.14.1 MediaLB (MLB) DC Characteristics

Table 72 lists the MediaLB 3-pin interface electrical characteristics.

Table 72. MediaLB 3-Pin Interface Electrical DC Specifications

Parameter	Symbol	Test Conditions	Min	Max	Unit
Maximum input voltage	—	—	—	3.6	V
Low level input threshold	$V_{\text{IL}}$	—	—	0.7	V
High level input threshold	$V_{\text{IH}}$	See Note <sup>1</sup>	1.8	—	V
Low level output threshold	$V_{\text{OL}}$	$I_{\text{OL}} = 6 \text{ mA}$	—	0.4	V
High level output threshold	$V_{\text{OH}}$	$I_{\text{OH}} = -6 \text{ mA}$	2.0	—	V
Input leakage current	$I_{\text{L}}$	$0 < V_{\text{in}} < V_{\text{DD}}$	—	$\pm 10$	$\mu\text{A}$

<sup>1</sup> Higher  $V_{\text{IH}}$  thresholds can be used; however, the risks associated with less noise margin in the system must be evaluated and assumed by the customer.

## Electrical Characteristics

Table 73 lists the MediaLB 6-pin interface electrical characteristics.

**Table 73. MediaLB 6-Pin Interface Electrical DC Specifications**

Parameter	Symbol	Test Conditions	Min	Max	Unit
<b>Driver Characteristics</b>					
Differential output voltage (steady-state): $ V_{O+} - V_{O-} $	$V_{OD}$	See Note <sup>1</sup>	300	500	mV
Difference in differential output voltage between (high/low) steady-states: $ V_{OD, high} - V_{OD, low} $	$\Delta V_{OD}$	—	-50	50	mV
Common-mode output voltage: $(V_{O+} - V_{O-}) / 2$	$V_{OCM}$	—	1.0	1.5	V
Difference in common-mode output between (high/low) steady-states: $ V_{OCM, high} - V_{OCM, low} $	$\Delta V_{OCM}$	—	-50	50	mV
Variations on common-mode output during a logic state transitions	$V_{CMV}$	See Note <sup>2</sup>	—	150	mVpp
Short circuit current	$ I_{OS} $	See Note <sup>3</sup>	—	43	mA
Differential output impedance	$Z_O$	—	1.6	—	k $\Omega$
<b>Receiver Characteristics</b>					
Differential clock input: • logic low steady-state • logic high steady-state • hysteresis	$V_{ILC}$ $V_{IHC}$ $V_{HSC}$	See Note <sup>4</sup>	— 50 -25	-50 — 25	mV mV mV
Differential signal/data input: • logic low steady-state • logic high steady-state	$V_{ILS}$ $V_{IHS}$	—	— 50	-50 —	mV mV
Signal-ended input voltage (steady-state): • MLB_SIG_P, MLB_DATA_P • MLB_SIG_N, MLB_DATA_N	$V_{IN+}$ $V_{IN-}$	—	0.5 0.5	2.0 2.0	V V

<sup>1</sup> The signal-ended output voltage of a driver is defined as  $V_{O+}$  on MLB\_CLK\_P, MLB\_SIG\_P, and MLB\_DATA\_P. The signal-ended output voltage of a driver is defined as  $V_{O-}$  on MLB\_CLK\_N, MLB\_SIG\_N, and MLB\_DATA\_N.

<sup>2</sup> Variations in the common-mode voltage can occur between logic states (for example, during state transitions) as a result of differences in the transition rate of  $V_{O+}$  and  $V_{O-}$ .

<sup>3</sup> Short circuit current is applicable when  $V_{O+}$  and  $V_{O-}$  are shorted together and/or shorted to ground.

<sup>4</sup> The logic state of the receiver is undefined when  $-50 \text{ mV} < V_{ID} < 50 \text{ mV}$ .

#### 4.11.14.2 MediaLB (MLB) Controller AC Timing Electrical Specifications

This section describes the timing electrical information of the MediaLB module. Figure 82 show the timing of MediaLB 3-pin interface, and Table 74 and Table 75 lists the MediaLB 3-pin interface timing characteristics.

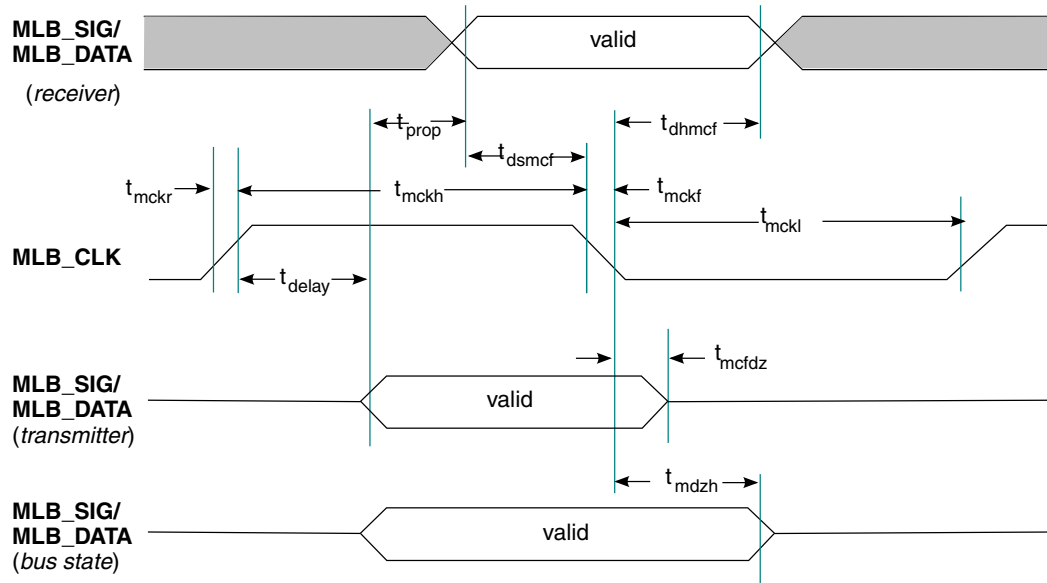

Figure 82. MediaLB 3-Pin Timing

Ground = 0.0 V; Load Capacitance = 60 pF; MediaLB speed = 256/512 Fs; Fs = 48 kHz; all timing parameters specified from the valid voltage threshold as listed below; unless otherwise noted.

Transmitter MLBSIG (MLBDAT) output valid from transition of MLBCLK (low-to-high)	$t_{\text{delay}}$	—	10.75	ns	—

<sup>1</sup> The controller can shut off MLB\_CLK to place MediaLB in a low-power state. Depending on the time the clock is shut off, a runt pulse can occur on MLB\_CLK.

<sup>2</sup> MLB\_CLK low/high time includes the pulse width variation.

<sup>3</sup> The MediaLB driver can release the MLB\_DATA/MLB\_SIG line as soon as MLB\_CLK is low; however, the logic state of the final driven bit on the line must remain on the bus for  $t_{\text{mdzh}}$ . Therefore, coupling must be minimized while meeting the maximum load capacitance listed.

Ground = 0.0 V; load capacitance = 40 pF; MediaLB speed = 1024 Fs; Fs = 48 kHz; all timing parameters specified from the valid voltage threshold as listed in Table 75; unless otherwise noted.

#### 4.11.15 PCIe PHY Parameters

The PCIe interface complies with PCIe specification Gen2 x1 lane and supports the PCI Express 1.1/2.0 standard.

### 4.11.15.1 PCIE\_REXT Reference Resistor Connection

The impedance calibration process requires connection of reference resistor 200  $\Omega$ . 1% precision resistor on PCIE\_REXT pads to ground. It is used for termination impedance calibration.

### 4.11.16 Pulse Width Modulator (PWM) Timing Parameters

This section describes the electrical information of the PWM. The PWM can be programmed to select one of three clock signals as its source frequency. The selected clock signal is passed through a prescaler before being input to the counter. The output is available at the pulse-width modulator output (PWMO) external pin.

Figure 84 depicts the timing of the PWM, and Table 77 lists the PWM timing parameters.

#### 4.11.18 SPDIF Timing Parameters

The Sony/Philips Digital Interconnect Format (SPDIF) data is sent using the bi-phase marking code. When encoding, the SPDIF data signal is modulated by a clock that is twice the bit rate of the data signal.

Table 79 and Figure 89 and Figure 90 show SPDIF timing parameters for the Sony/Philips Digital Interconnect Format (SPDIF), including the timing of the modulating Rx clock (SPDIF\_SR\_CLK) for SPDIF in Rx mode and the timing of the modulating Tx clock (SPDIF\_ST\_CLK) for SPDIF in Tx mode.

Table 79. SPDIF Timing Parameters

SS42	AUDx_RXD setup before AUDx_TXC falling	10.0	—	ns
SS43	AUDx_RXD hold after AUDx_TXC falling	0.0	—	ns

**NOTE**

- All the timings for the SSI are given for a non-inverted serial clock polarity (TSCKP/RSCKP = 0) and a non-inverted frame sync (TFSI/RFSI = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the clock signal AUDx\_TXC/AUDx\_RXC and/or the frame sync AUDx\_TXFS/AUDx\_RXFS shown in the tables and in the figures.
- All timings are on Audiomux Pads when SSI is being used for data transfer.
- The terms, WL and BL, refer to Word Length (WL) and Bit Length (BL).
- For internal Frame Sync operation using external clock, the frame sync timing is same as that of transmit data (for example, during AC97 mode of operation).

## 4.11.20 UART I/O Configuration and Timing Parameters

### 4.11.20.1 UART RS-232 I/O Configuration in Different Modes

The i.MX 6Solo/6DualLite UART interfaces can serve both as DTE or DCE device. This can be configured by the DCEDTE control bit (default 0—DCE mode). Table 85 shows the UART I/O configuration based on the enabled mode.

Table 85. UART I/O Configuration vs. Mode

Port	DTE Mode		DCE Mode	
	Direction	Description	Direction	Description
UARTx_RTS_B	Output	RTS from DTE to DCE	Input	RTS from DTE to DCE
UARTx_CTS_B	Input	CTS from DCE to DTE	Output	CTS from DCE to DTE
UARTx_DTR_B	Output	DTR from DTE to DCE	Input	DTR from DTE to DCE
UARTx_DSR_B	Input	DSR from DCE to DTE	Output	DSR from DCE to DTE
UARTx_DCD_B	Input	DCD from DCE to DTE	Output	DCD from DCE to DTE
UARTx_RI_B	Input	RING from DCE to DTE	Output	RING from DCE to DTE
UARTx_TX_DATA	Input	Serial data from DCE to DTE	Output	Serial data from DCE to DTE
UARTx_RX_DATA	Output	Serial data from DTE to DCE	Input	Serial data from DTE to DCE

### 4.11.20.2 UART RS-232 Serial Mode Timing

The following sections describe the electrical information of the UART module in the RS-232 mode.

#### 4.11.20.2.1 UART Transmitter

Figure 95 depicts the transmit timing of UART in the RS-232 serial mode, with 8 data bit/1 stop bit format. Table 86 lists the UART RS-232 serial mode transmit timing characteristics.

Figure 95. UART RS-232 Serial Mode Transmit Timing Diagram

Table 86. RS-232 Serial Mode Transmit Timing Parameters

ID	Parameter	Symbol	Min	Max	Unit
UA1	Transmit Bit Time	$t_{Tbit}$	$1/F_{baud\_rate}^1 - T_{ref\_clk}^2$	$1/F_{baud\_rate} + T_{ref\_clk}$	—

<sup>1</sup>  $F_{baud\_rate}$ : Baud rate frequency. The maximum baud rate the UART can support is ( $ipg\_perclk$  frequency)/16.

<sup>2</sup>  $T_{ref\_clk}$ : The period of UART reference clock  $ref\_clk$  ( $ipg\_perclk$  after RFDIV divider).

### 4.11.20.2.2 UART Receiver

Figure 96 depicts the RS-232 serial mode receive timing with 8 data bit/1 stop bit format. Table 87 lists serial mode receive timing characteristics.

Figure 96. UART RS-232 Serial Mode Receive Timing Diagram

Table 87. RS-232 Serial Mode Receive Timing Parameters

ID	Parameter	Symbol	Min	Max	Unit
UA2	Receive Bit Time <sup>1</sup>	$t_{Rbit}$	$1/F_{baud\_rate}^2 - 1/(16 \times F_{baud\_rate})$	$1/F_{baud\_rate} + 1/(16 \times F_{baud\_rate})$	—

<sup>1</sup> The UART receiver can tolerate  $1/(16 \times F_{baud\_rate})$  tolerance in each bit. But accumulation tolerance in one frame must not exceed  $3/(16 \times F_{baud\_rate})$ .

<sup>2</sup>  $F_{baud\_rate}$ : Baud rate frequency. The maximum baud rate the UART can support is  $(ipg\_perclk \text{ frequency})/16$ .

### 4.11.20.2.3 UART IrDA Mode Timing

The following subsections give the UART transmit and receive timings in IrDA mode.

#### UART IrDA Mode Transmitter

Figure 97 depicts the UART IrDA mode transmit timing, with 8 data bit/1 stop bit format. Table 88 lists the transmit timing characteristics.

Figure 97. UART IrDA Mode Transmit Timing Diagram

Table 88. IrDA Mode Transmit Timing Parameters

ID	Parameter	Symbol	Min	Max	Unit
UA3	Transmit Bit Time in IrDA mode	$t_{TIRbit}$	$1/F_{baud\_rate}^1 - T_{ref\_clk}^2$	$1/F_{baud\_rate} + T_{ref\_clk}$	—
UA4	Transmit IR Pulse Duration	$t_{TIRpulse}$	$(3/16) \times (1/F_{baud\_rate}) - T_{ref\_clk}$	$(3/16) \times (1/F_{baud\_rate}) + T_{ref\_clk}$	—

<sup>1</sup>  $F_{baud\_rate}$ : Baud rate frequency. The maximum baud rate the UART can support is  $(ipg\_perclk \text{ frequency})/16$ .

<sup>2</sup>  $T_{ref\_clk}$ : The period of UART reference clock  $ref\_clk$  ( $ipg\_perclk$  after RFDIV divider).

## UART IrDA Mode Receiver

Figure 98 depicts the UART IrDA mode receive timing, with 8 data bit/1 stop bit format. Table 89 lists the receive timing characteristics.

Figure 98. UART IrDA Mode Receive Timing Diagram

Table 89. IrDA Mode Receive Timing Parameters

ID	Parameter	Symbol	Min	Max	Unit
UA5	Receive Bit Time <sup>1</sup> in IrDA mode	$t_{RIRbit}$	$1/F_{baud\_rate}^2 - 1/(16 \times F_{baud\_rate})$	$1/F_{baud\_rate} + 1/(16 \times F_{baud\_rate})$	—
UA6	Receive IR Pulse Duration	$t_{RIRpulse}$	1.41 $\mu$ s	$(5/16) \times (1/F_{baud\_rate})$	—

<sup>1</sup> The UART receiver can tolerate  $1/(16 \times F_{baud\_rate})$  tolerance in each bit. But accumulation tolerance in one frame must not exceed  $3/(16 \times F_{baud\_rate})$ .

<sup>2</sup>  $F_{baud\_rate}$ : Baud rate frequency. The maximum baud rate the UART can support is  $(ipg\_perclk \text{ frequency})/16$ .

## 4.11.21 USB HSIC Timings

This section describes the electrical information of the USB HSIC port.

### NOTE

HSIC is DDR signal, following timing spec is for both rising and falling edge.

## 5 Boot Mode Configuration

This section provides information on boot mode configuration pins allocation and boot devices interfaces allocation.

### 5.1 Boot Mode Configuration Pins

[Table 92](#) provides boot options, functionality, fuse values, and associated pins. Several input pins are also sampled at reset and can be used to override fuse values, depending on the value of BT\_FUSE\_SEL fuse. The boot option pins are in effect when BT\_FUSE\_SEL fuse is '0' (cleared, which is the case for an unblown fuse). For detailed boot mode options configured by the boot mode pins, see the i.MX 6Solo/6DualLite Fuse Map document and the System Boot chapter in *i.MX 6Solo/6DualLite Reference Manual (IMX6SDLRM)*.

**Table 92. Fuses and Associated Pins Used for Boot**

<sup>1</sup> Pin value overrides fuse settings for BT\_FUSE\_SEL = '0'. Signal Configuration as Fuse Override Input at Power Up. These are special I/O lines that control the boot up configuration during product development. In production, the boot configuration can be controlled by fuses.

## 5.2 Boot Device Interface Allocation

Table 93 lists the interfaces that can be used by the boot process in accordance with the specific boot mode configuration. The table also describes the interface's specific modes and IOMUXC allocation, which are configured during boot when appropriate.

## 6 Package Information and Contact Assignments

This section includes the contact assignment information and mechanical package drawing.

### 6.1 Updated Signal Naming Convention

The signal names of the i.MX6 series of products have been standardized to better align the signal names within the family and across the documentation. Some of the benefits of these changes are as follows:

- The names are unique within the scope of an SoC and within the series of products
- Searches will return all occurrences of the named signal
- The names are consistent between i.MX 6 series products implementing the same modules
- The module instance is incorporated into the signal name

This change applies only to signal names. The original ball names have been preserved to prevent the need to change schematics, BSDL models, IBIS models, etc.

Throughout this document, the updated signal names are used except where referenced as a ball name (such as the Functional Contact Assignments table, Ball Map table, and so on). A master list of the signal name changes is in the document, *IMX 6 Series Signal Name Mapping* (EB792). This list can be used to map the signal names used in older documentation to the new standardized naming conventions.

<sup>1</sup> The state immediately after reset and before ROM firmware or software has executed.

<sup>2</sup> Variance of the pull-up and pull-down strengths are shown in the tables as follows:

<sup>3</sup> ENET\_REF\_CLK is used as a clock source for MII and RGMII modes only. RGMII mode uses either GPIO\_16 or RGMII\_TX\_CTL as a clock source. For more information on these clocks, see the device Reference Manual and the Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors (IMX6DQ6SDLHDG).
